Overview:

gStore is the new platform for inventory management and the Runner app. It supports product requests, cycle counts, shipping, receiving, and a new try-on experience. gStore empowers teams to deliver elevated consumer experiences by streamlining how we manage inventory and run product to the floor. Designed for all store associates and leaders, gStore streamlines these experiences so we can focus connecting with the consumer. Every piece of the platform is built to help you spend less time searching for product and more time connecting with consumers, fulfilling our mission to keep the service at the center of everything we do.

Log In Steps

Click into the gStore App and log in via SSO.

- Log in using your employee ID at Deckers.com (i.e., employee_id@deckers.com).
- It's important to note that MFA suppression is activated with App version 2.52.1 (7464).
- If you're having trouble logging in, reach out to your Store Manager – they can help verify your account is set up correctly.
- For technical issues contact the Help Desk.

gStore is available on MPOS devices only and is not available on the iPads.
iPhone: NA, EMEA & Japan. V2Pro/X5 Android MPOS: China

Runner App and Try-On Experience

The Runner App in gStore enables teams to deliver true 1:1 service and enhance the try-on experience. Allowing team members to instantly request styles from the BOH to be brought to the sales floor for consumers, introducing them to new styles, and creating a seamless, elevated try-on moment.

Use the Runner app to request products by size, color, and style while staying with the consumer. Requests are fulfilled by other team members and tracked in the app. Requests are nearly instant. The system tracks **accept** and **fulfill** times for coaching and recognition.

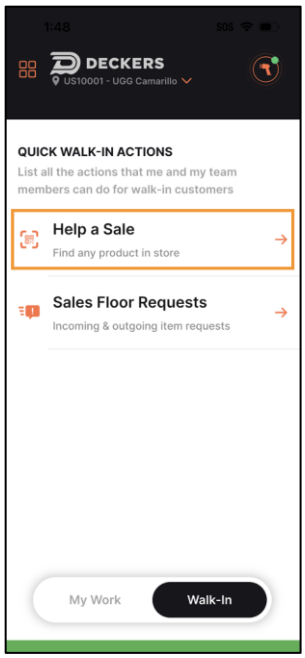

The Runner App is designed to help improve the try-on experience for both our teams and our consumers, but it is not required for every single try-on. We know that staffing models and store-specific constraints can vary, so each store should find what works best for their team and daily operations. The more the Runner App is used, the more data we can capture to better understand our consumers at a deeper level and continue improving the experience over time. Best Practice is to use it during high-impact moments, such as when staffing is strongest, or integrate it into everyday processes where it adds the most value. Use it in ways that best support your store, your team, and the overall customer experience.

Runner App Note:

- If items requested are damaged or offsite, items should be updated to the correct RFID status (damaged, offsite, etc.), which removes them from Runner App availability while maintaining inventory accuracy. Items at offsite are not available in the Runner App search, to exclude these from requests, but will remain in your stock on hand.

Send Product Requests

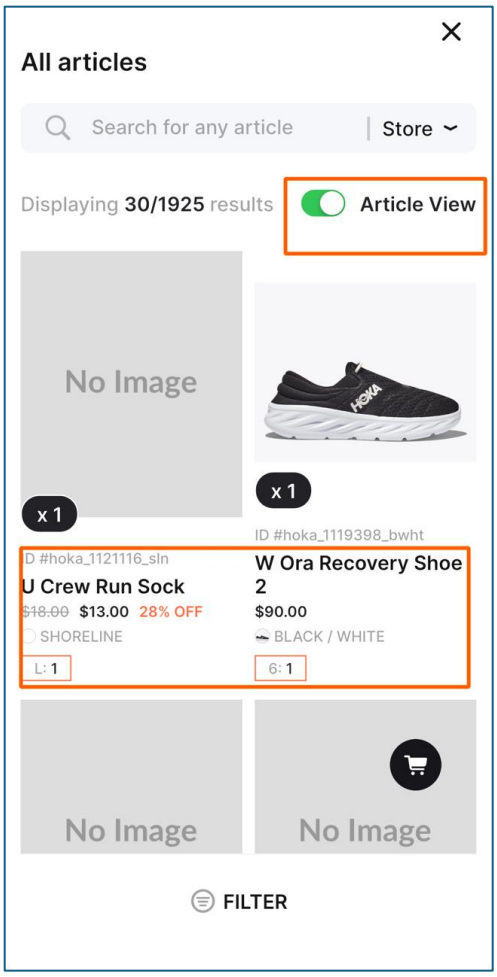

1. Tap the **Walk-in** tab to go to the Runner App Screen.
2. Tap **Help a Sale**.

3. Selecting one of the following options to Look Up Product:
    a. Use the **Search** function
        i. Search functionality includes style names or numbers
    b. Tap **View All Products**
    c. Tap **View by Category**
    d. or **Scan Barcode**
4. On the **Product Page**, review **Location**, **Colors**, **Sizes** (including international sizes) and **Latest Store on Hand** which updates automatically based on POS sales.
   Note: Offsite inventory counts toward your total stock on hand, however, items in Offsite cannot be requested through the Runner App.

    a. If item isn't available in your store, choose **Company** in the dropdown to search all products in the full catalog.
    b. **Price** can be viewed in the Product Catalog and Product Description Pages, including current and original pricing where applicable.

    (China Region: Price feature is not available)
        i. From the Full Catalog view select Article View to see Pricing at the item level:

ii. You will find the price from the Product Description Page, found underneath the Style Name.

iii. To make it easier to view available **color options**, color icons may be displayed when product images are unavailable.

iv. The **Latest Store on Hand** field provides a more current inventory view between cycle counts.

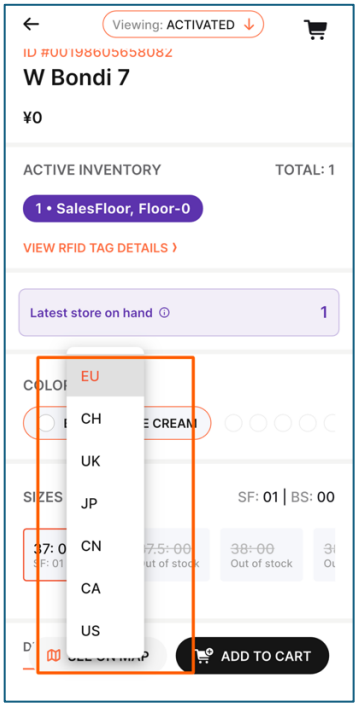

1. As products are sold, the **Latest Store on Hand** quantity adjusts to reflect those sales within 5-10 minutes.
2. **Active Inventory Store on Hand** continues to update when a cycle count is completed, and from shipping and receiving processes.
3. Because it reflects recent sales, Latest Store on Hand may differ from the Active Inventory quantity.

Best Practice When reviewing inventory for Runner App requests, reference the **Latest Store On Hand** field to understand the most current available quantity in the store.

Optional: Tap **See on Map** to utilize the RFID sled to search for the item.

v. Select a country from the **Sizes dropdown** to view product sizes in that country's sizing system.
Note: Changing the size view in the Product Catalog does not affect other screens. The Runner App Cart and fulfillment screens will continue to show US sizes. If you need to verify an international size conversion, go back to the Product Catalog.

5. Tap **Add to Cart** to start a request (you can add multiple items).
6. Tap **Send Request** to request product to the salesfloor. Keep guiding the consumer while your teammate runs the product.
7. Once product arrives, it's important to present the product in an elevated way to the consumer.
    a. Footwear should be laced and clean.
    b. Delivered with one shoe out and packaged paper cleared for a seamless try-on.

Fulfill Requests

Support associates connecting with consumers on the sales floor by fulfilling product requests so they can remain with the consumer. Follow the steps below:

Ensure you are logged into gStore with the Runner App page open when you're available to fulfill requests so you receive notifications.

1. Tap the **Walk-in** tab to get to the Runner App.
2. When a request comes through, you will see a notification titled "pending sales floor request".
3. Tap **View Request** to view details (sender, delivery location).
4. Tap **Accept Request**.
5. Tap the item to see product location in BOH.
6. Locate the item in **BOH**.
7. Once located, tap **Pick** to update status.
8. Tap **Finish** when handing the item to the associate/consumer to complete.

When running product to the salesfloor, keep these 2 behaviors in mind:

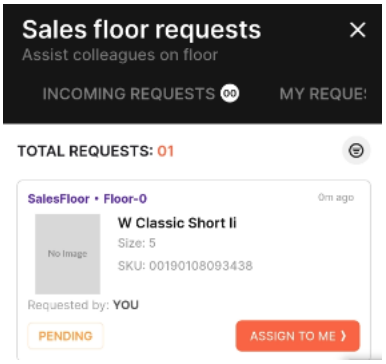

1. Organization: Maintain request organization and deliver product requests in order received on the Runner App.
2. Communication:
    a. If a delivered product was incorrect from a product request, it's important to swap out the correct product before continuing with remaining deliveries.
    b. If the consumer found an additional product while waiting that they'd like to try-on, communicate the request in the **Runner App** so it may be fulfilled through the queue of product requests.

Can't find the item?

If you ask for help, and someone can support to complete the request:

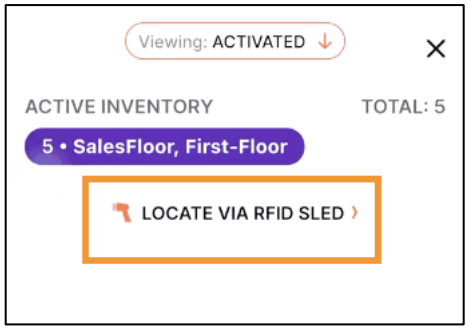

1. Tap **Sales Floor Requests**
2. Locate the request to take over

3. Select **Assign to Me**
4. Complete the request as above.

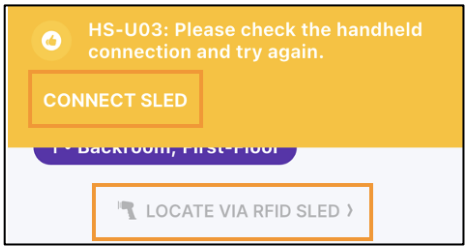

Or use the **Gieger Counter** to find a specific item:

1. From the **item details** screen, tap **Locate via RFID Sled** to launch the Geiger counter.

2. If your sled is not connected, after selecting the greyed out **Locate via RFID Sled**, tap **Connect Sled**

3. Walk around the area, as you get closer to the item, the screen will show you when you've gotten close enough and located it.

Try-On Experience Training

Turn every try-on request into a memorable, high conversion fit experience with fast, personal, and complete service. Follow the steps below when providing a try-on experience.

Salesfloor Service:

1. Welcome the consumer and discover their needs and size quickly.

   Actions:
   a. Ask consumers about fit to determine if they may need an additional size up or down (request another size up or down depending on their response)
   b. Offer to measure their foot for sizing via SafeSize (HOKA) or Brannick device.
2. Encourage consumers to try-on the product immediately. Request a product in the Runner App.
3. Repeat their requests back to them for confirmation when requesting in Runner App.
4. Always request at least 2 additional pairs in the runner app, for a total of 3 style requests as a Global standard.

Consider these additional products:

a. Additional Sizes.
b. Different colors.
c. Similar styles.
d. Franchise (HOKA) or core product (UGG).
e. New styles for the season.

5. Ensure the consumer has a comfortable place to try-on.

   Actions:

   a. Prepare the space in advance by ensuring it is clean and tidy.
   b. Offer try-on socks if needed.

6. While the runner grabs their product, continue to connect with the consumer, learn about their preferences and engage with the consumer by offering the following:

   a. Socks
   b. Apparel
   c. New items in cross categories.
   d. Ask who else are they shopping for?
   e. Talk to them about upcoming store events or run clubs.

   Service Examples:

   - "I'll request a couple sizes for you and an alternative style that I think you'll love. Have you seen our newest apparel that matches the footwear you are looking at?"
   - "Good news, I can see your size right now. I'll have it brought up while we keep looking at color options. I also want to mention a store event coming soon that I know you will be excited to learn more about."
   - "I've sent the request; while it's on the way, let's talk through fit and alternatives you might love."

7. When the requested product arrives:

   a. Bend down on a knee offering the products they requested to try on.
   b. Invite them to try the product out in the store.
   c. Share where the closest mirror is so they can see the product during try-on.
   d. Listen closely to the consumer without bias or judgement for fit feedback and be ready to submit another product request for an updated size or style.
   e. Share the return and exchange policy, or in HOKA's case the trial policy to ensure trust and confidence.

Inventory Management

gStore supports receiving, shipments (store to store and Return to Warehouse), RFID tag encoding, RFID status updates, and full cycle counts across all store locations (salesfloor, backstock and offsite, where applicable). These functions help ensure inventory accuracy. Whether we are performing in-store counts or shipping product to other stores or to the warehouse, these features ensure we have visibility of the products in our store. When we have accurate inventory counts in store, we can provide the consumer with the product they want, when they want it.

Connecting to a Sled

Use the RFID sled to locate product via Gieger functionality. There are several Inventory Management Ad-hoc functions where this is useful, such as:

- Full Cycle Count
- Update RFID EPC (Electric Product Code)
- Encode new RFID tags

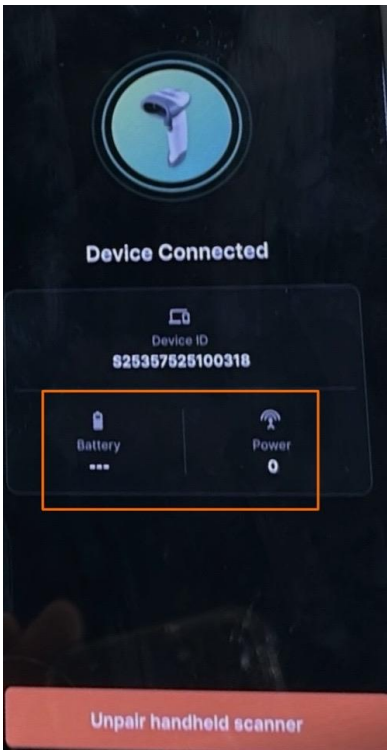

Connect Steps:

1. Turn on Zebra RFID Sled and ensure the Bluetooth light is blinking.
2. If RFID Sled is not connected:
    1. Go to **Settings.**
    2. Select **Bluetooth.**
    3. Select the correct **RFID device**.
    4. If first time connecting, hold down the sled **trigger button** to secure connection.
3. Return to **gStore app.**
4. Tap the **sled icon** in the top right corner.
5. Tap **Scan barcode** and scan the serial number on the top of the RFID sled.
    - You can also manually enter the serial number by selecting the icon at the bottom.

NOTE: For the RFD40 Sled, the serial number is on top after removing the cover. You can print and laminate a photo of the serial number barcode and attach it to the sled to prevent needing to remove the cover every time.

6. gStore will show **Device Connected** and you can return to other RFID processes.
   Note: A Battery or Power reading of 0 indicates an unsuccessful pairing. Select **Unpair handheld scanner**, re-pair the device, and confirm that Battery and Power levels are displayed before proceeding.

7. Select the **X** on the top right to return to other gStore processes.

Shipping (Creating a Transfer)

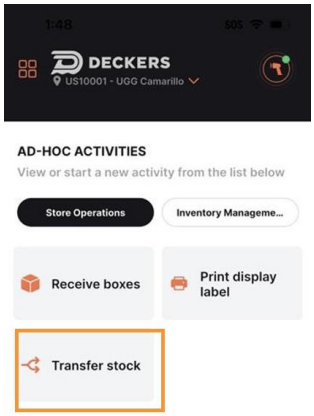

Use gStore to create shipments for transfer. Each box must have its own Shipment and Carton number**.** Do not combine multiple boxes under one transfer, as this can cause inventory and receiving issues. **Do not** create transfers while a cycle count is in progress.

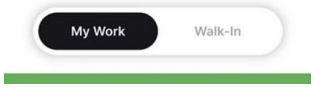

Shipping Notes:

- All EPCs tags associated with completed transfers are placed in **In Transit** status. While items marked as In Transit are excluded from Cycle Counts, they should be shipped out as soon as possible after creation to prevent aging while in route.
- If you are sending a transfer to a store that is still using Halo, send it from Halo (NA & CHINA)
- If you are sending a transfer to a store that is still using SIM, send it from SIM (JAPAN & EMEA)
- **Damages:** All Damages should have RFID tags updated to Damage status while physically in store to prevent them from being available for Runner App requests. Sending these items as an **RTW – Damages** will remove the status and create the transfer in the same step.

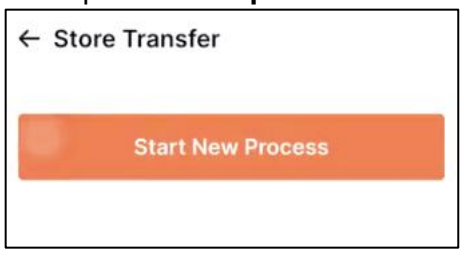

Best practice is to scan items into each box as you pack it to ensure the transfer matches the physical items being shipped.

1. Tap **Transfer Stock**.

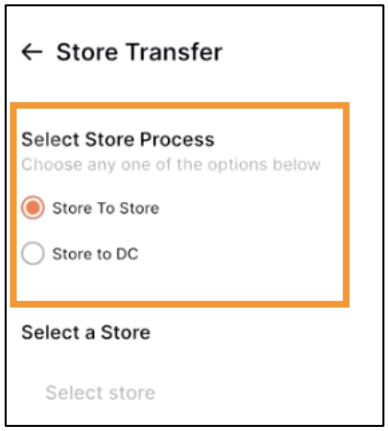

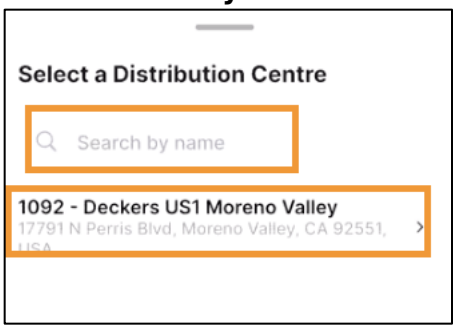

2. Tap **start new process**.

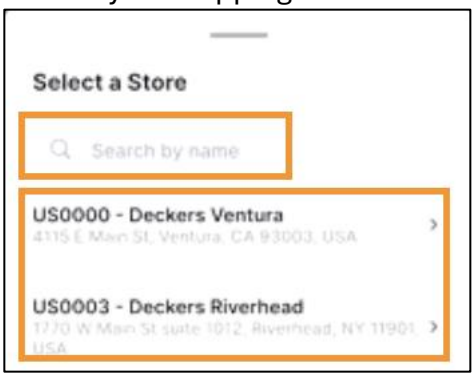

3. Select **Store to Store** transfer or **Store to DC** (warehouse transfer).

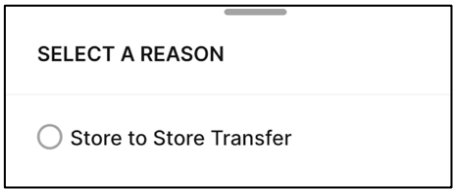

4. The process is the same after selecting the type of transfer you are creating. This example is a store-to-store transfer.
5. Locate the store or DC you are transferring to in the **drop-down list** or using the **search by name** function to locate your shipping destination.

6. Select a **Reason.**

7. Tap **submit.**
8. Validate that the details on the screen are correct, including the **To** location.
    - If the To location is incorrect, use the back arrow to make a change before continuing.
9. A preview of your shipment label will show on the screen. Tap **Print Label** on the bottom of the screen to print to your Zebra printer. Only the label required for the type of transfer generated will print.
    - Shipment ID = Return to Warehouse
    - Carton = Store to Store Transfer

    NOTE: If your Zebra Printer is unavailable, select **Continue without printing** to move to the next step.

10. Fill out the carton label for the outside of the box, attaching the gStore labels where appropriate and placing in the proper area for the receiving location to use.

CARTON LABEL

Store Number:	Date:
Return Number:	Carton _____ of _____
Shipped On:	

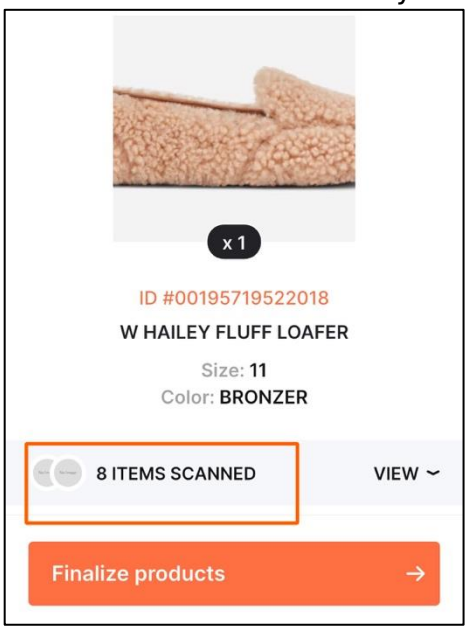

Please circle one

Transfer	Return To Warehouse	Damages	Processed eCommerce Return

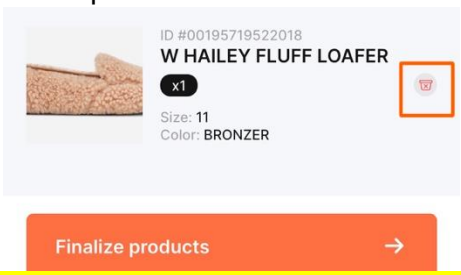

Transfer Details (If Applicable):

Destination Store Number:	Destination Store Address:

11. Scan the products via RFID as you fill the box, using one scan trigger per item.
12. The last item you scanned will show on the screen as well as a running total. Select **View** to monitor items as they are being added to the transfer.

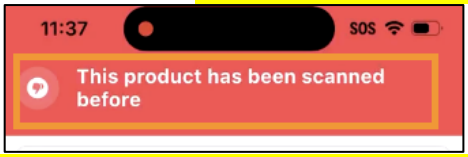

13. If you notice items in the list that were not physically added to the box, open the list and tap the **trash icon** to delete it.

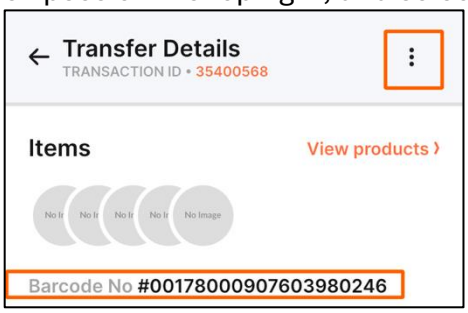

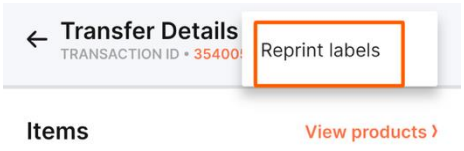

14. Keep an eye out for any Red banners at the top of the screen and stop to troubleshoot as needed.

- **This product has been scanned before:** Make sure you still have the correct number of expected products already scanned into the transfer.
- **EPC state not allowed for this process:** Only EPCs in Available or Damaged status can be added to a transfer. All other statuses cannot be added to a transfer.
    i. Utilize another gStore device to check the status and update if needed.
    ii. If already In Transit, this item was already included in a completed transfer and should be researched.

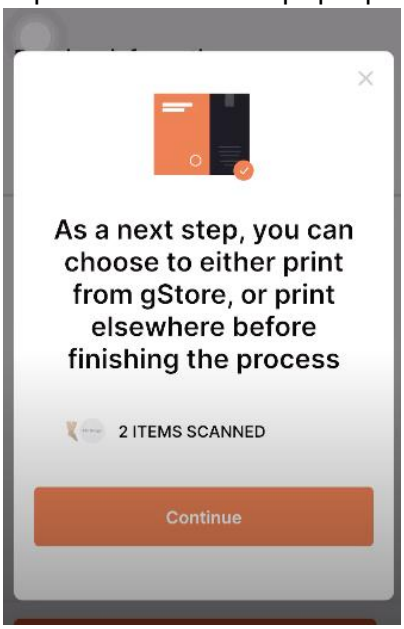

15. When all items have been added to the transfer, Tap **Finalize products**.
16. Review the details and make sure the carton number on the box matches the Barcode Number on the screen. If you need to reprint a carton label, select the ellipses on the top right, and select **Reprint labels**.

17. Select **Mark Done** to create the shipment. This completes the transfer and sends it for processing, regardless of any selections on the following screens.
18. Tap **Continue** in the pop-up.

19. Tap **Print Receipt** to print a packing list from your store printer or **Finish Without Printing** to skip printing.
20. Place printed packing list inside of the box for the receiving location, as applicable.
21. If transferring multiple boxes, repeat steps 1-22.

Receiving (Store to Store Transfers or Warehouse Transfers)

Receiving in gStore is used to process warehouse deliveries and store-to-store transfers. Receiving confirms full cartons, not individual items, and applies all items assigned to each carton into your inventory. Location, ownership, and availability are updated automatically after completion.

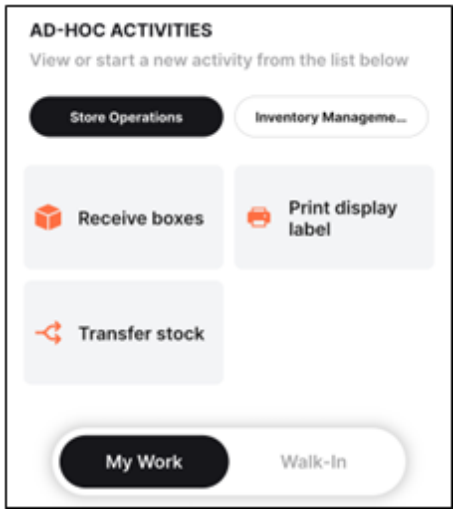

Each receiving action may include multiple cartons, but cartons must be received separately based on their original shipment source. For example, if you receive 10 warehouse cartons and 3 store-to-store transfer cartons at the same time, you must complete two separate receiving actions. One for warehouse cartons and one for transfer cartons.

Receiving Notes:

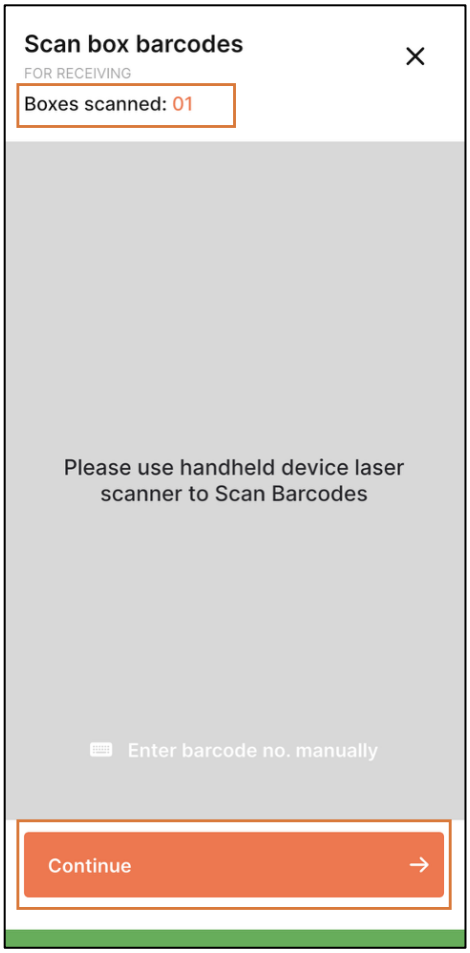

- The final step includes an RFID scan of the shipment contents. However, regardless of how many items within the carton are RFID scanned, selecting **Finish** confirms the entire carton in full. All items assigned to that carton will be received into inventory automatically.
- If you are receiving a transfer originally shipped in Halo, receive it in Halo.
- If you are receiving a transfer originally shipped in SIM, receive it in SIM.
- If a carton shows as unrecognized, delete it and scan it again. If it is still unrecognized but should be receivable, open a helpdesk ticket with the carton details and sending location, attaching photos if possible. Set the carton aside or remove the label until the issue is resolved. If it is not received before the next cycle count, the items will appear as extra on that count.
- If the carton number is not scannable but is legible, hand key into gStore. For a DC shipment, you can also check the ERP for the carton number. If the Carton number is missing, open a ticket with the helpdesk including the sending location, and the Shipment Number (or External Number) from SIM.

First Receiving Steps: Receive Cartons

1. Ensure your RFID sled is connected.
2. Tap **receive boxes** in the **my work** tab.

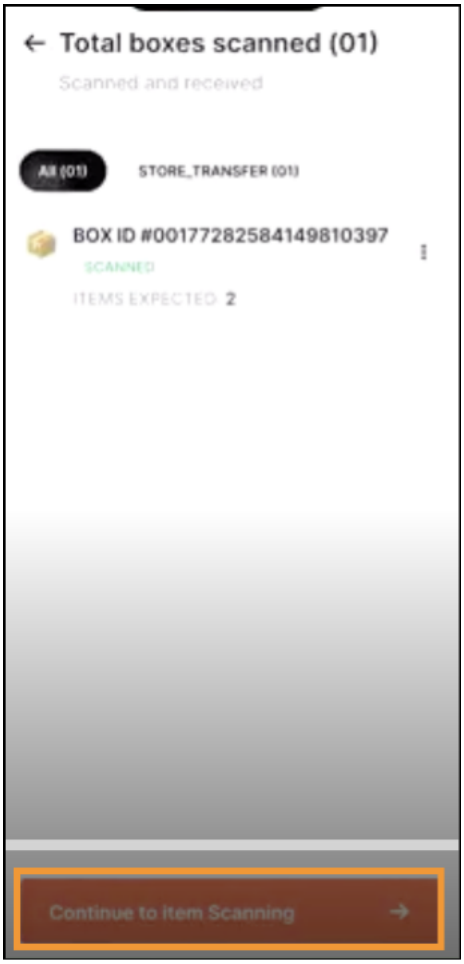

3. Scan **carton labels** for all cartons, the app will show you how many you've scanned.

4. Tap **Continue** at the bottom of the screen. A list of the cartons you scanned will show.

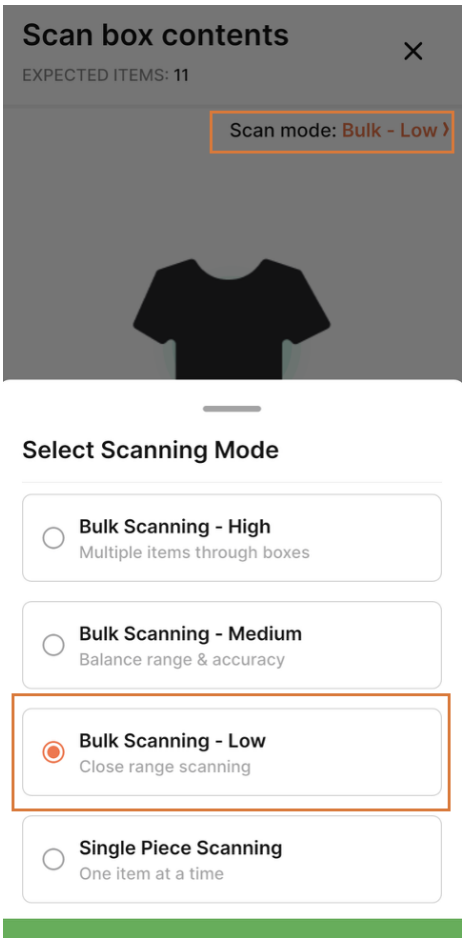

Next Receiving Steps: Confirm Items

5. Tap **Continue to Item Scanning**, then Start scanning.

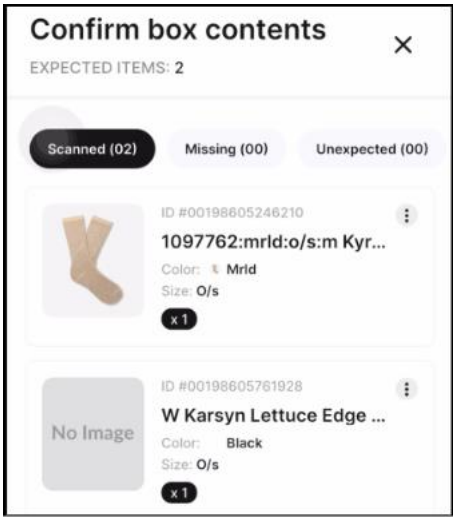

6. On the Scan box contents page, select **Scan mode**, to increase or decrease the power level of the RFID scanner, as needed. Select the scan mode that works best for your store's configuration.
    a. Bulk – High will scan multiple items through many boxes.
    b. Bulk – Medium is the default, and balances power range.
    c. Bulk – Low is recommended for close range scanning.
    d. Single Piece Scanning will require you to scan each EPC tag as you are unpacking the box and is not recommended unless you are completing an audit.

    NOTE: The power you select before you select Start Scanning cannot be changed until your next receiving action.

7. Select **Start scanning** and wave the RFID sled around all unpacked boxes.
8. Select **Finish Capturing** to review the results of the RFID scan. Items shown in the Missing tab should be visually verified during unpacking to determine whether they need to be encoded before your next cycle count or if they should be reported as missing to the sending location.

9. Select the location where the items will be put away.

   Note: This will allow inventory accuracy for Runner App product requests until the next Cycle Count.

   a. **Salesfloor**
   b. **Backstock**
   c. **Offsite** (if applicable)

10. Tap **Finish** at the bottom of the screen. gStore will display the total number of cartons received.
    a. When Finish is selected, each carton is fully received, even if not all RFID tags were scanned in the previous step.
    b. Items in the Missing tab do not prevent receiving, do not block the carton from being received, and do not create or trigger inventory adjustments.
    c. All cartons are received in full once **Finish** is selected.
    d. The RFID scan does not impact the items that are received and stock on hand for the full carton will be updated once **Finish** is selected.

11. Tap **Done**.

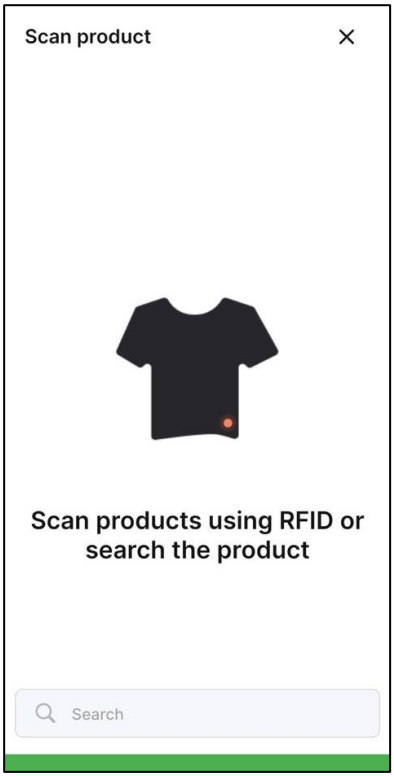

Optional Final Step: Shipping and Receiving Validation

Shipping and Receiving functionality can be validated in Angel Reporting within five minutes of completing the processes. You can also utilize SIM to validate shipping and receiving as needed (there could be a 30-minute to 1 hour delay). If you do not see details after one hour, or different details between SIM and Angel reporting, open a ticket with the helpdesk including as much detail as possible.

Printing Display Labels

Print display labels to identify products on the sales floor and quickly show key details like style, color, size, and price. Display labels support printing the original and markdown price, as applicable, but will not update for promotional pricing

1. Select **My Work**, then tap **Print Label** in the bottom left.
2. Scan the barcode using the iPhone camera, RFID (if the Sled is connected) or search the company master list to find the item.

3. Review the item details, then select **Print Display Label**. If the pricing is not correct, please utilize SIM to print as needed.

4. The label will print to your store's Zebra label printer

Creating an EPC Tag:

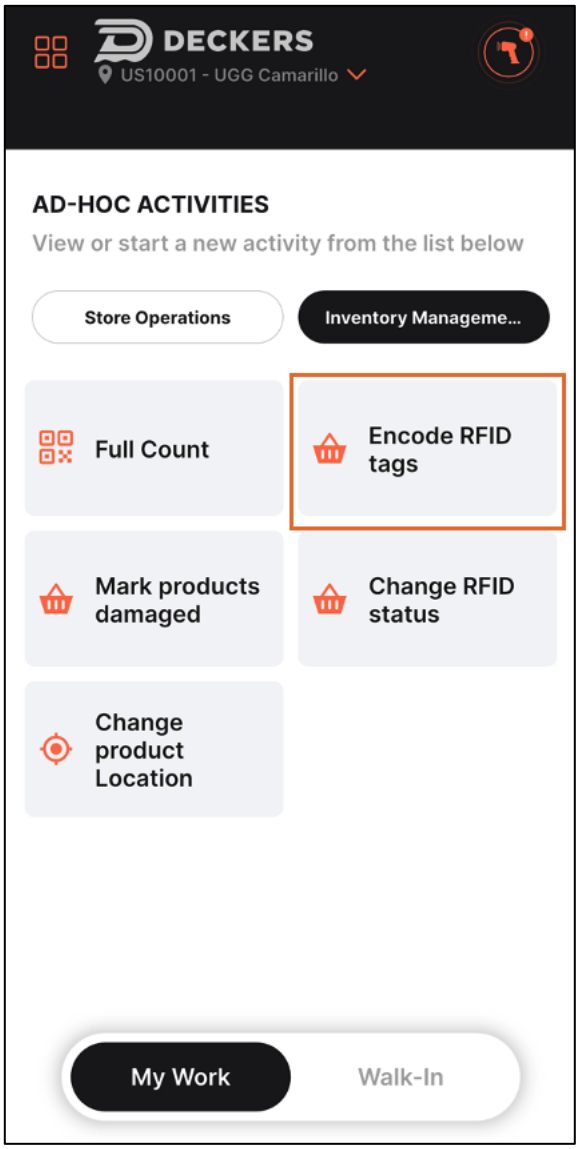

If an EPC tag is damaged, missing or associated with the incorrect item, you may need to create a new tag following the process below.

Notes:

- When replacing due to an incorrect tag, make sure to properly remove and destroy the tag to maintain inventory accuracy and so that it is no longer scanned in future cycle counts.

- You can utilize the RFID status of Display or On Mannequin to identify these items, without affecting your Cycle Count accuracy. Visibility to items with this status will be found in Cycle Count reporting. An enhanced Display experience is planned for future enhancements.

1. Make sure you have the scanner connected.
2. Tap **My Work**
3. Tap **Inventory Management**
4. Tap **Encode RFID tags**

5. Search the product catalog, or use the laser on the RFID scanner to scan the UPC.
6. Tap **Continue to scan RFID tag**.

5. Take a blank EPC tag and place against the scanner.

6. Click the **trigger** once, which will take you to the second page.

7. Click the **trigger** one more time.
8. It will beep three times which means you are done and now encoded.
9. Tap **Done.**

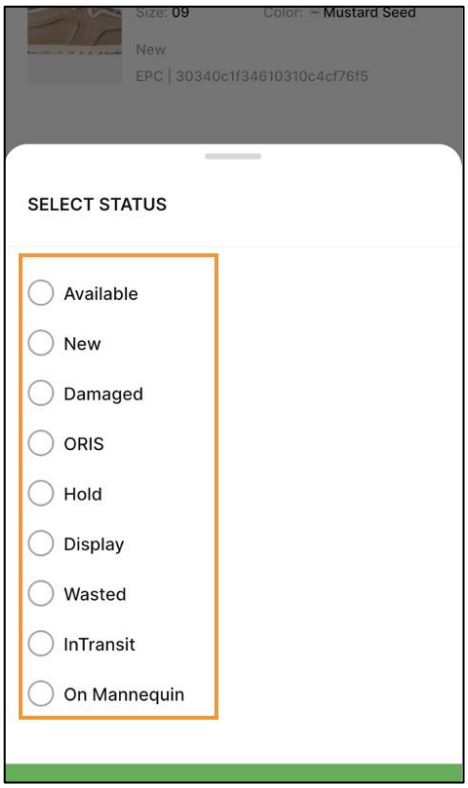

Updating the RFID Status of an Item

You can update the RFID Status of an item to statuses like, “Hold” or “Damaged”. This will ensure you do not receive a Runner App request for items that are unable to be sold to a consumer due to other obligations or processes.

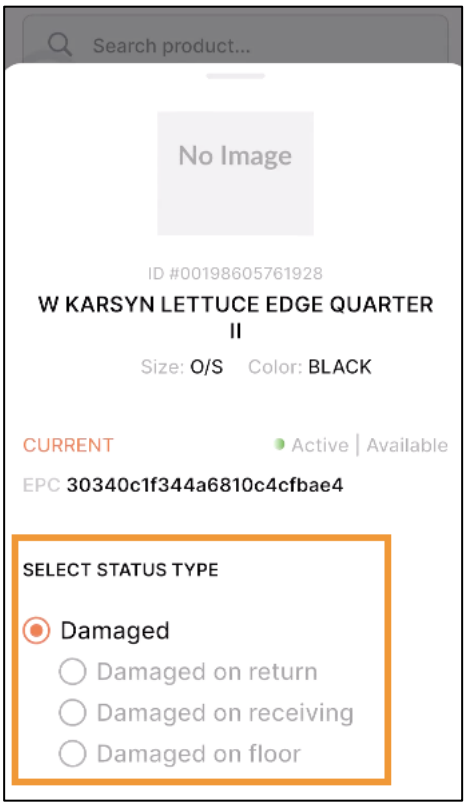

Damages: All Damages should have RFID tags updated to Damage status while physically in store to prevent them from being available for Runner App requests.

For Online returns that are not part of inventory, update the RFID status to **ORIS** to exclude from cycle counts. If this cannot be completed, ensure items are shielded or removed from the store before starting a cycle count.

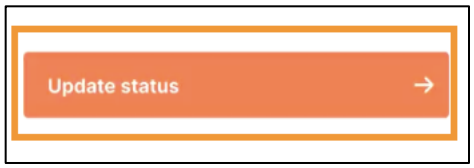

1. Make sure the sled is connected.
2. In the gStore app tap **My Work**
3. Tap **Inventory Management**
4. Tap **Change RFID Status**
5. Scan the **RFID label**.
6. Select the status you’d like the item changed to.

1. When selecting **Damaged**, you can also select a status type to specify the details.

7. Tap **Update Status.**

8. Scan again if you want to check if the status changed correctly or to change it back to the default of **Available**.

    - Statuses that count towards inventory:
        - Available
        - Damaged
        - Hold
        - Display
        - On Mannequin
    - Statuses that do not count towards inventory:
        - Wasted (EPC is no longer attached to the item or has been replaced by another tag).
        - In-Transit
        - ORIS (Online Return in Store)

Cycle Count:

Cycle Count is one of the most important tools your team has for protecting store inventory. Accurate counts give our teams real time visibility into what product is on hand, flag discrepancies that may indicate loss or process errors, and serve as a key input for asset protection audits. When inventory is accurate, we can better serve our consumers. When variances are caught early, we can investigate and correct them before they compound.

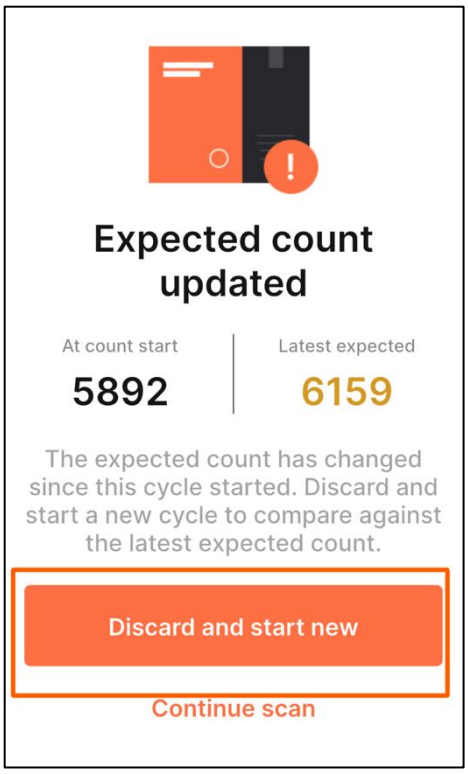

Cycle Counts are completed by scanning RFID tags within each item's designated location. Be sure to scan in the correctly labeled location, as this is used for Runner App requests. The system uses sled-to-tag proximity to ensure each item is counted only once and assigned to the correct location.

Logistics:

- Scans generally start in the backroom, but it doesn't matter whichever part of the store that you are in. If you're in your off site, ensure you select that in the app.
- Begin Cycle Counts at 5:00 AM local time or later to ensure accurate SIM stock on hand (updated overnight).
- Do not receive transfers the morning before your cycle count as they will not be included in the SIM Snapshot and will cause variances. Reschedule your cycle count, if possible. If you must proceed with a cycle count shield or remove items from the field of RFID capture during the count and only receive after a cycle count is approved to avoid variance and/or double counting.
- **Online Returns:** Remove, shield or ship out online returns before counting to ensure they remain excluded from your cycle count.

Cycle Count Tracking:

- The **Full Count** button shows you the last time a count was scanned and what the last count total was. You can also click last 7 counts to get a view of what the last seven cycle counts have been for reference.
- When opening the Cycle Count function, if the count was started on a different date, you may see a pop-up indicating your Stock on Hand has changed. Select **Discard and start new** to ensure you are counting against the most up to date expected stock on hand to limit variances.

For more details regarding Cycle Counts, please reference our Policy and Procedures.

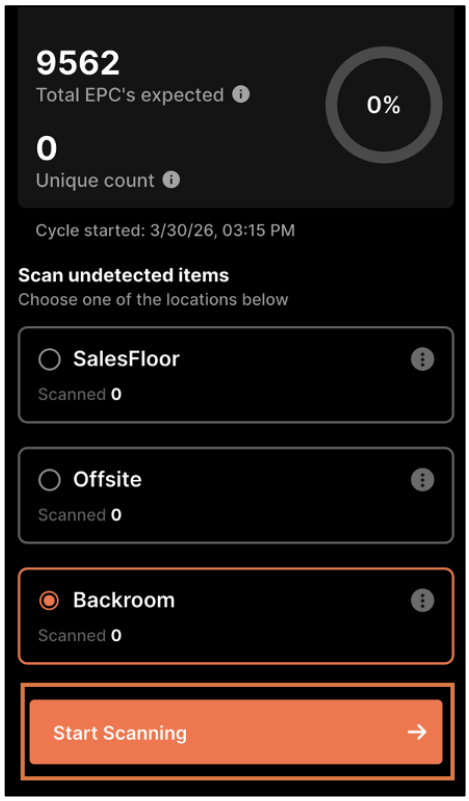

1. Make sure your sled is connected. If you get disconnected during the count, you can reconnect using the sled icon on the top right.
2. Tap **My Work**
3. Tap **Inventory Management**
4. Tap **Full Count**
5. The details of the last count will show as a baseline, select **Start Count** to begin a new count.
6. Select the **Location** where you are starting your count, then **Start Scanning**.

   Location Notes:

   - Total EPCs expected is your current SIM stock on hand, and Unique Count is the amount of unique EPCs that are scanned, which will increase as you complete each location.
   - If onsite storage units are accessed for customer try-on requests, include these items with your "Backroom" location. Future Enhancements have been requested to create store specific, instead of generic locations.
   - If there is a location with no product, it still needs to be completed to submit your count. Go to a spot in the store away from product, start and finish your

count quickly with either zero items counted or only a few items counted. When all locations are complete, submit and approve your count.

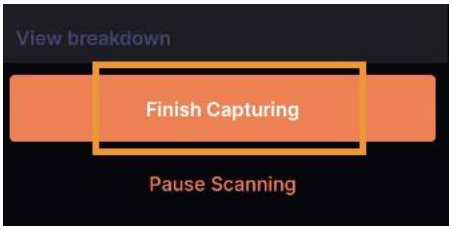

- If a location needs to be deleted, open a ticket with the helpdesk requesting the extra location is removed for your store.
- If a location needs to be added, open a ticket with the helpdesk requesting that the new location is added. Include the scheduled day so this location will be updated for your next Cycle Count.
- RFID may pick up nearby items, but each item is only counted once. Keep counting items in their true location. Accuracy matters most and location will sort itself out.
- The count may start at a negative accuracy rate if you have negative stock on hand in your inventory. There is nothing to worry about and you should continue your count as normal. Negative stock on hand will be adjusted in SIM once the 98%+ threshold is achieved on an approved count.
- Once a cycle count starts, **you can add multiple users** based on available hardware and devices. Results are combined into one total and are not shown by user. Each EPC is counted only once, even if scanned multiple times. Users can scan in different locations at the same time.

7. Tap **Start Scanning**

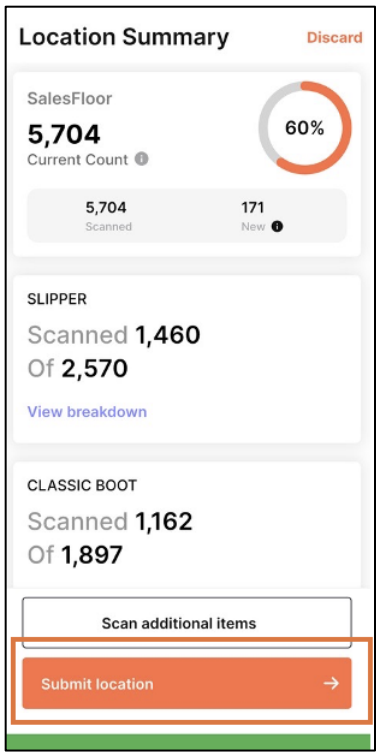

8. Walk around the area to capture all EPCs. View the total of what's being counted on the top left, including the full Overall count, and the location specific details.
    - Items showing as **New**, have not been counted before, and may not be received yet.
    - Counts by category can be viewed in the bottom section.
9. Once scanning is complete in that area, tap **Finish Capturing**.

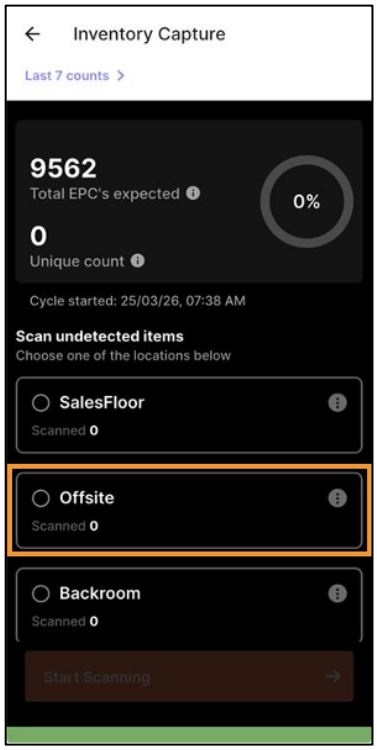

10. Review the details on the **Location Summary** page.

NOTE: The indicator in the top right shows Count Progress, which represents the percentage of total stock on hand that has been counted for that location.

11. Once satisfied with the count, tap **Submit Location**.

12. Complete your count in each area of the store, by selecting each location.

13. Tap **start scanning**.
14. Repeat steps 6-11.

RFID Sled Power Selection During Cycle Counts

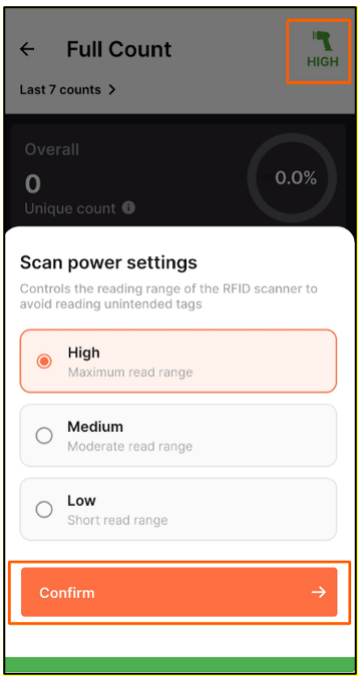

Teams can adjust the RFID sled power level from High to Low directly within a cycle count, similar to Receiving.

This feature is useful when counting inventory near products that should not be included in the count.

> Ex) an UGG stores located next to another retailer that sells UGG products can reduce read range to help prevent unintended tag reads. As a reminder, brand is already filtered from the backend, so this is not needed when a HOKA store is near an UGG store.

Steps:

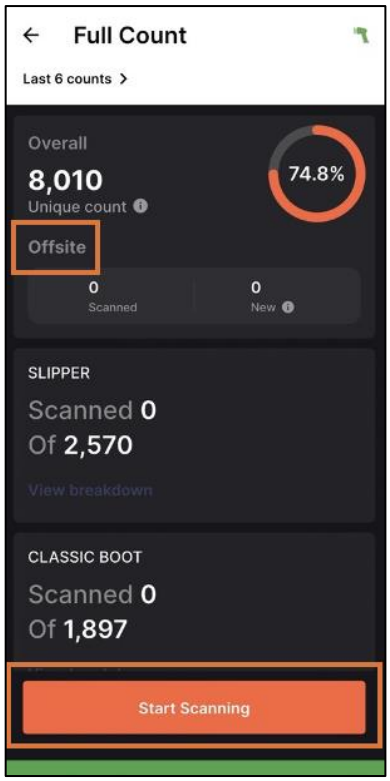

1. Once you start a cycle count, the RFID power setting will appear in the top-right corner of the screen, replacing the previous sled connection indicator.
    - The displayed icon shows the current selected power level.
2. Tap the **icon** at any time to choose a different power setting, then **Confirm**.
    - Note: Power levels can be changed throughout the count and do not need to remain the same for the entire activity.

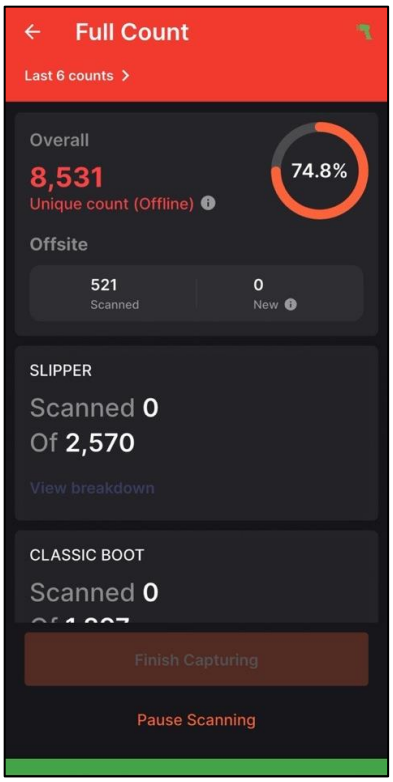

Counting Offline

You must have Wi-Fi to complete a location or submit a count. However, you can scan temporarily while offline. This is useful when counting offsite locations without Wi-Fi or a hotspot. No other processes currently have offline capability.

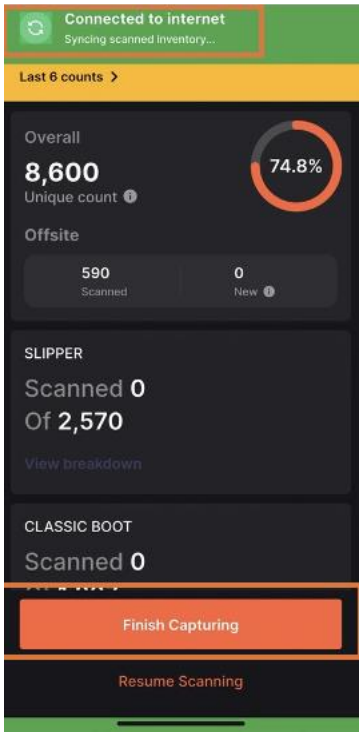

1. **Before you go offline**, you must start the **Location** while you still have connection. Once you are on the location scanning page, you may go offline.
2. When you arrive at the Offsite, select **Start Scanning**, to begin the location count.

3. Continue scanning items as usual. The app will show that it is in **Offline** mode. Use **Pause Scanning** if you need to move between offsite areas.

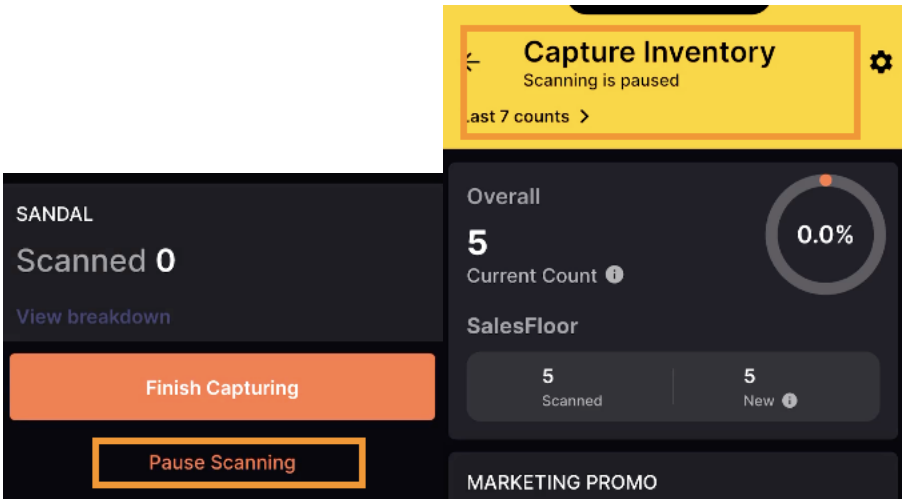

4. When Wi-Fi is available again select **Finish Capturing**.

To add to a specific location count

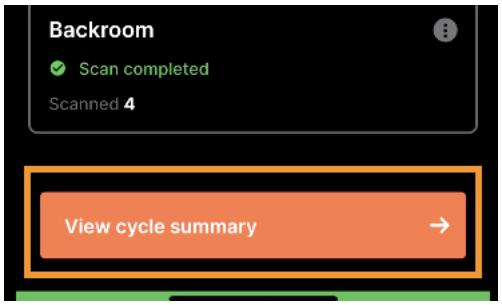

- From the Location Selection screen, select the **Location.**
- Tap the **three dots** in the top right of that box.
- Tap **resume scanning**.
- Note: You can also tap **pause scanning** if you are walking between areas or need to pause for a moment.

- Tap **resume to continue** in the same location where you paused.

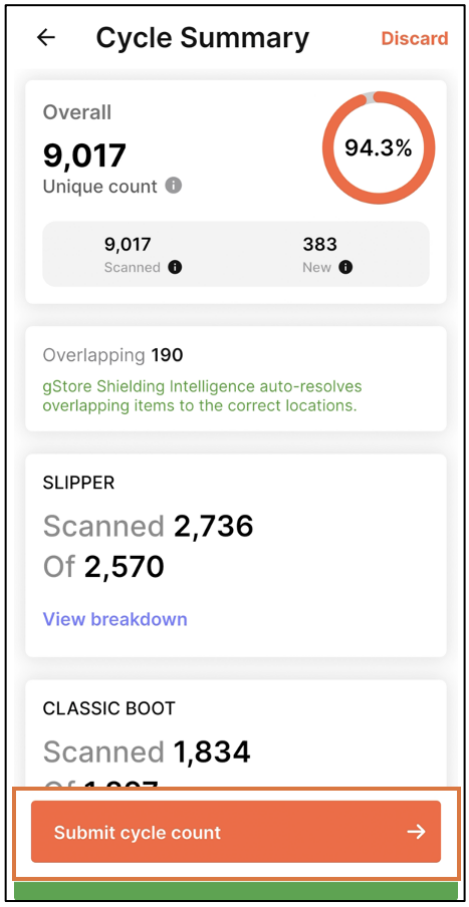

Completing the Count

1. Tap **View Count Summary** when you have completed the count for every location of your store.

2. Review the details of the screen ensuring you've completed the count to the best of your ability. Once satisfied with the count, tap **Submit Cycle Count.**
    - If you would like to go back to add items to a location, use the back arrow on the upper left.
    - **Scanning Note:**

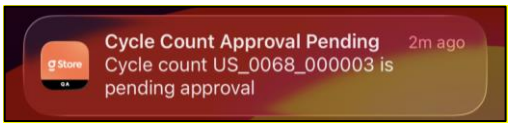

- Overlapping quantities reflect EPCs scanned in multiple locations but counted only once in the final total based on proximity. This is informational only and does not affect results.

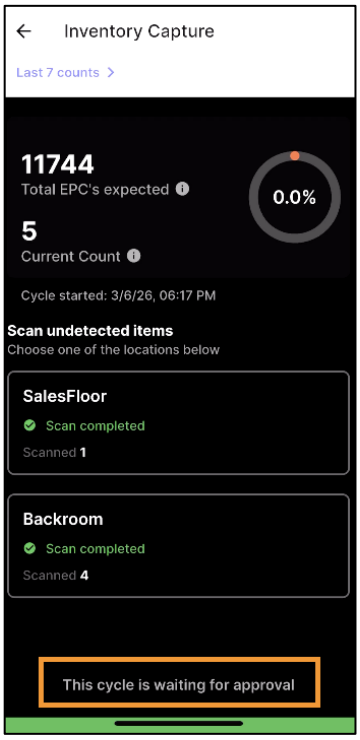

3. Once submitted to management for review, you will see a Green Notification bar at the top of the screen showing the **Task is Completed.**

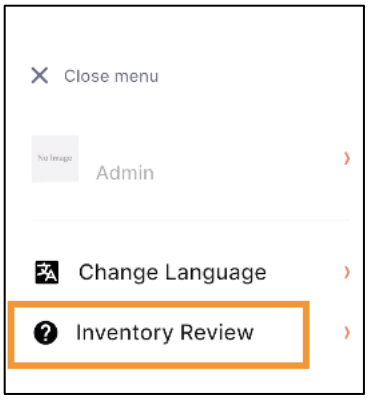

4. After the count is submitted, leadership review is still required. All variances should be reviewed and reconciled if possible. Once satisfied with the results, the count must be approved through the Inventory Review process in the left menu for the cycle count to be considered completed.
    - This should be completed the same day of the count to ensure accuracy is captured. Managers will see a system app notification every two hours as a reminder to approve.

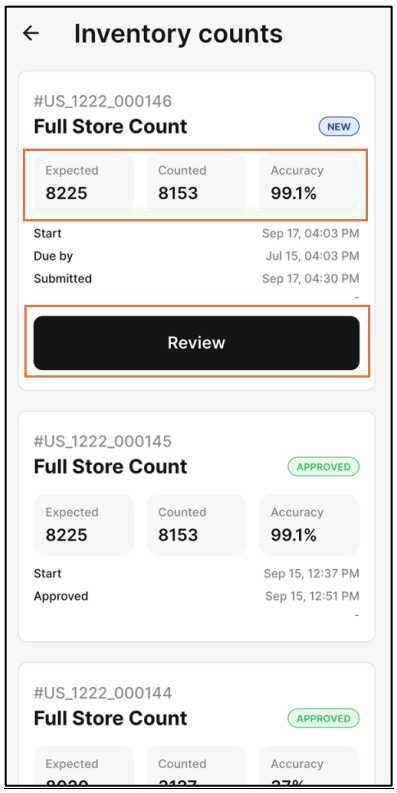

- Store Leadership must approve the Cycle Count submitted *before store opens* following the steps below.
- You cannot complete another count until the count is Approved or Rejected.

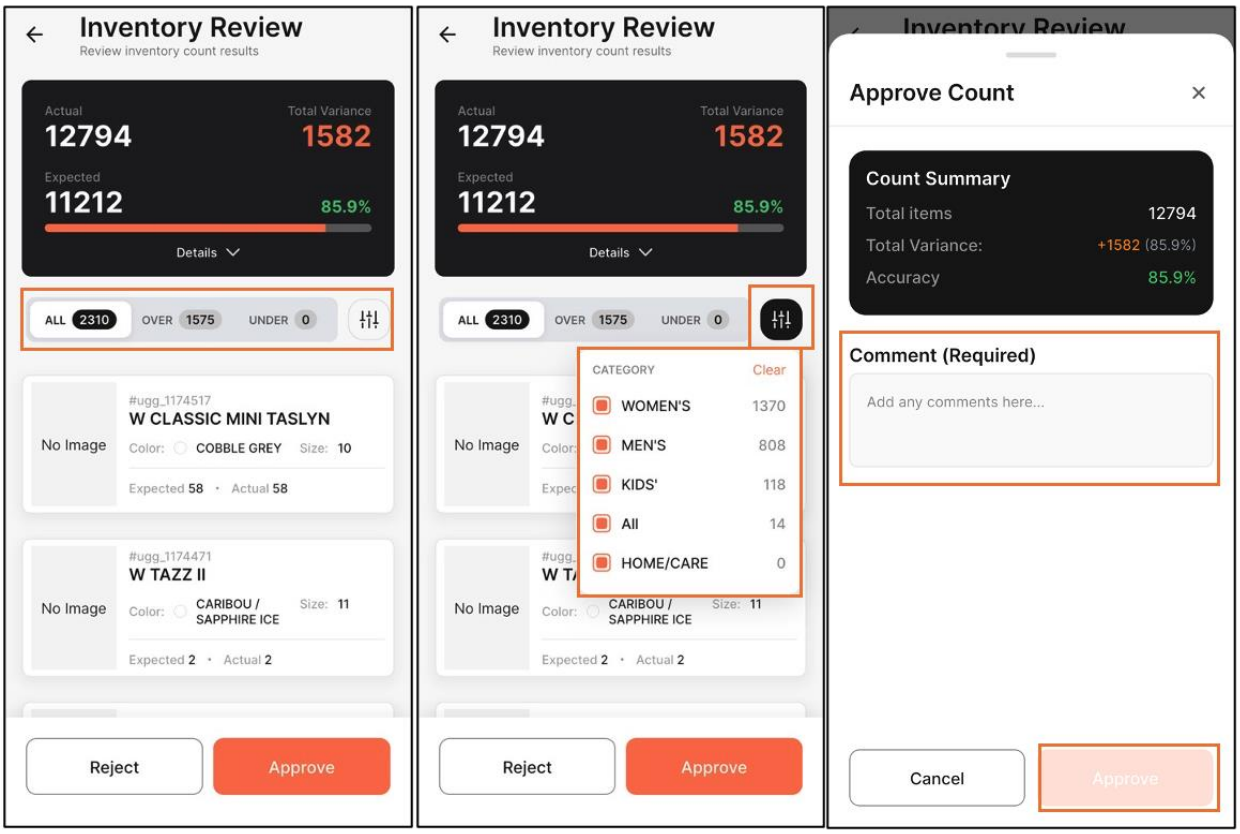

1. From the gStore main screen, tap the **Menu** button on the top left.
2. Tap **Inventory Review.**

3. Tap **Review.** You will be able to review current and previous count details including total counted, expected, and accuracy percentage.

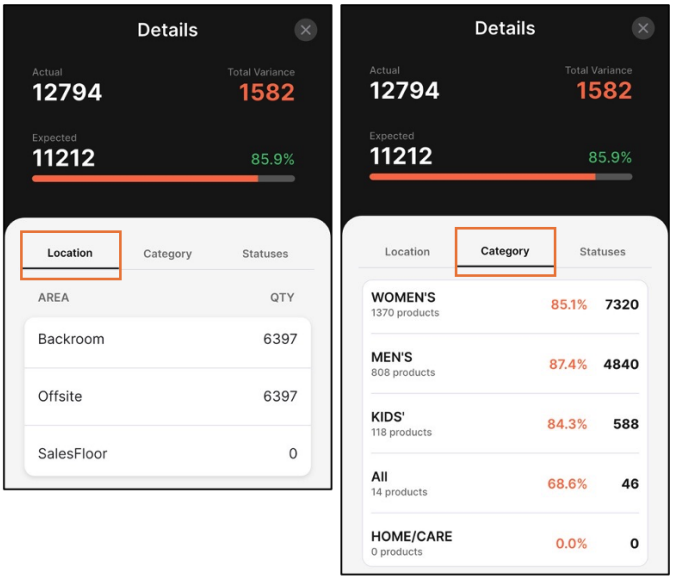

4. Store leader must review all identified variances, then select **approve** or **reject**.
    - It's important to note Keyholders and above are automatically set up as Approvers through SSO login, based on Workday setup.

Additional steps to help review variances:

a. Utilize the tabs to view items by over or under
b. Select the filter button to select one or more category at a time to review
c. Select the **Details** button to view additional information by location, and category

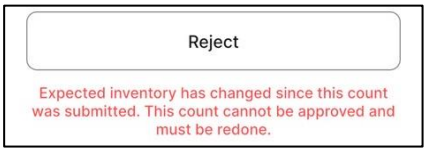

5. When you are satisfied with the results of your count, select **Approve**:

- Approved counts with accuracy of 98% and above will flow to SIM (Store Inventory Management) for automatic adjustments, as needed.
- If you approve a count under 98%, you must input a reason in the **comments** and your Region's Operations team will review. If accuracy does not improve over multiple counts, you may need to manually adjust.

6. Once approved, the Cycle Count is complete.

If a count was not approved on the same day it was completed:

SIM inventory updates daily. As a result, any cycle count that is not approved on the day it was completed must be rejected and recounted. When this occurs, the **Approve** button will no longer be available.

If you selected reject, you have 2 option to chose from:

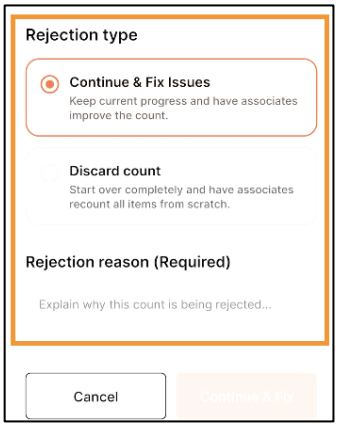

Option 1 – Continue & Fix: If your SIM stock on hand hasn't updated, your store is not yet open and you have time to add additional items to the count, tap **continue and fix.**

- Return to **Count menu.**
- Begin scanning any missed items and/or locations.
- Tap **submit** to follow the approval process outlined above.

Option 2: Select **Discard Count** and associate will have to recount all items.

- Note: Once count is discarded, it will not be available in any reporting.

1. Once selected, fill out the **reason** in the comments describing why it was rejected.

2. Follow current Policy and Procedure for troubleshooting and manual adjustments as needed.
3. RFID Material Variance report must be completed on the Deck.

Reporting

This section provides Store Leaders with instructions and context for accessing and using the gStore retail reporting tool through the Retail Splash Page.

Log In

Log into the gStore Reporting web app following the steps below.

a. Go to the https://us.gstore.cloud/ link to access gStore reporting.

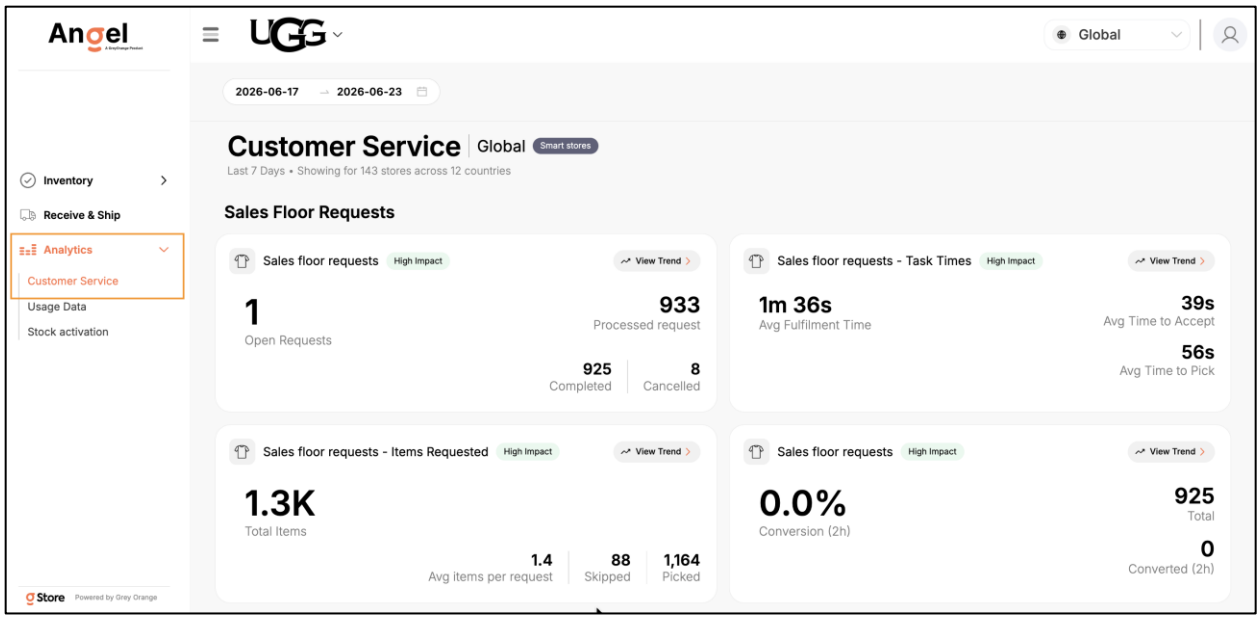

a. Log in via **SSO** using your EmployeeID@Deckers.com

    a. Submit a **Help Desk Ticket** if you run into log in issues or contact your Regional Retail Ops partner.

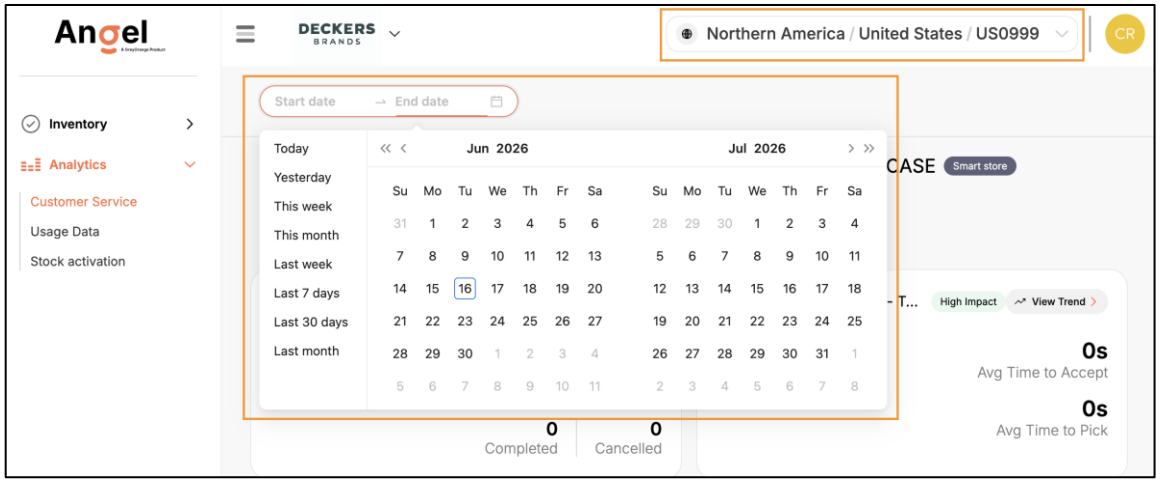

Customer Service (Runner App Reporting)

The Customer Service (Runner App) reporting provides visibility to try-on data. It's important to note that the filtered view will provide one store at a time view.

a. Log in using the steps above
b. Click the **Analytics** drop down
c. Select **Customer Service** to see Runner App Data

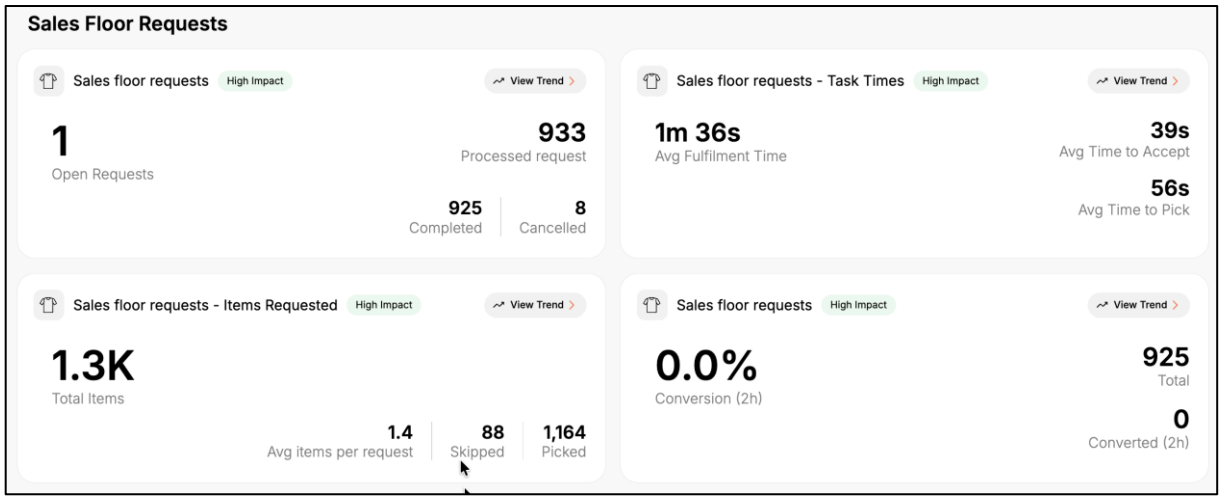

d. Apply the following filters:
    b. Select **Store Location (if needed)**
    c. Select **Date or Date Range**

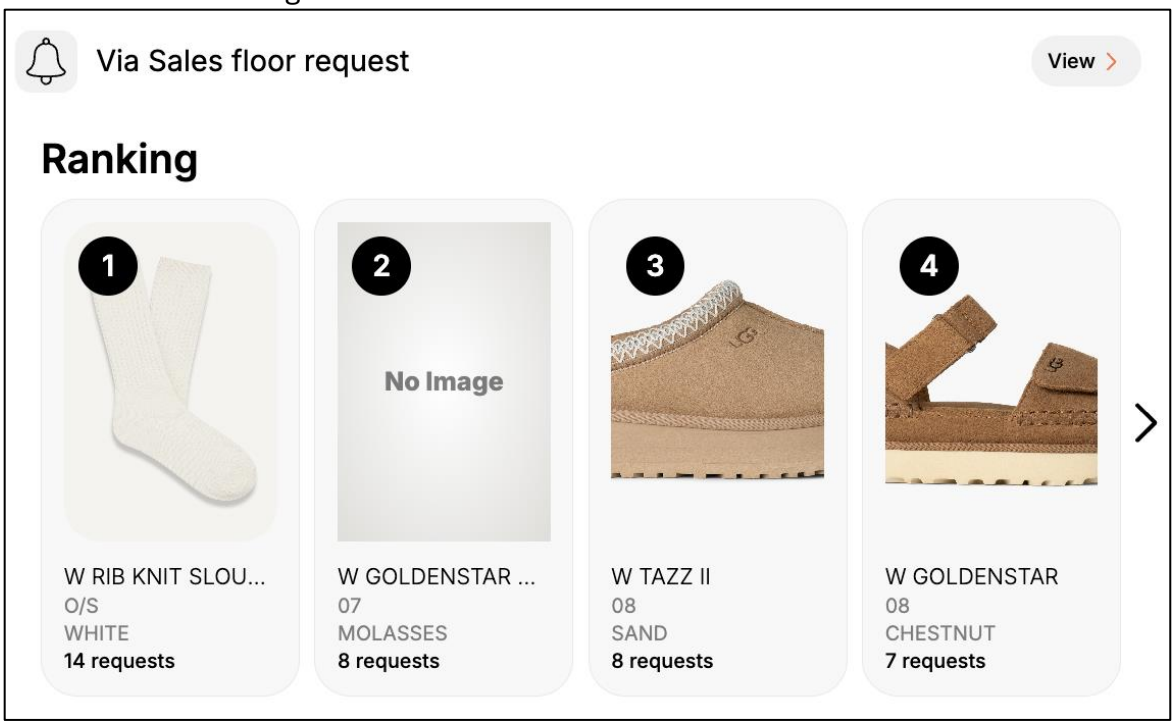

e. Review the following Data:
    d. Sales floor requests
        i. Open requests
        ii. Processed requests
        iii. Completed/ Cancelled requests
    e. **Sales floor requests** – task times
        i. Average fulfillment time
        ii. Average time to accept
        iii. Average time to pick

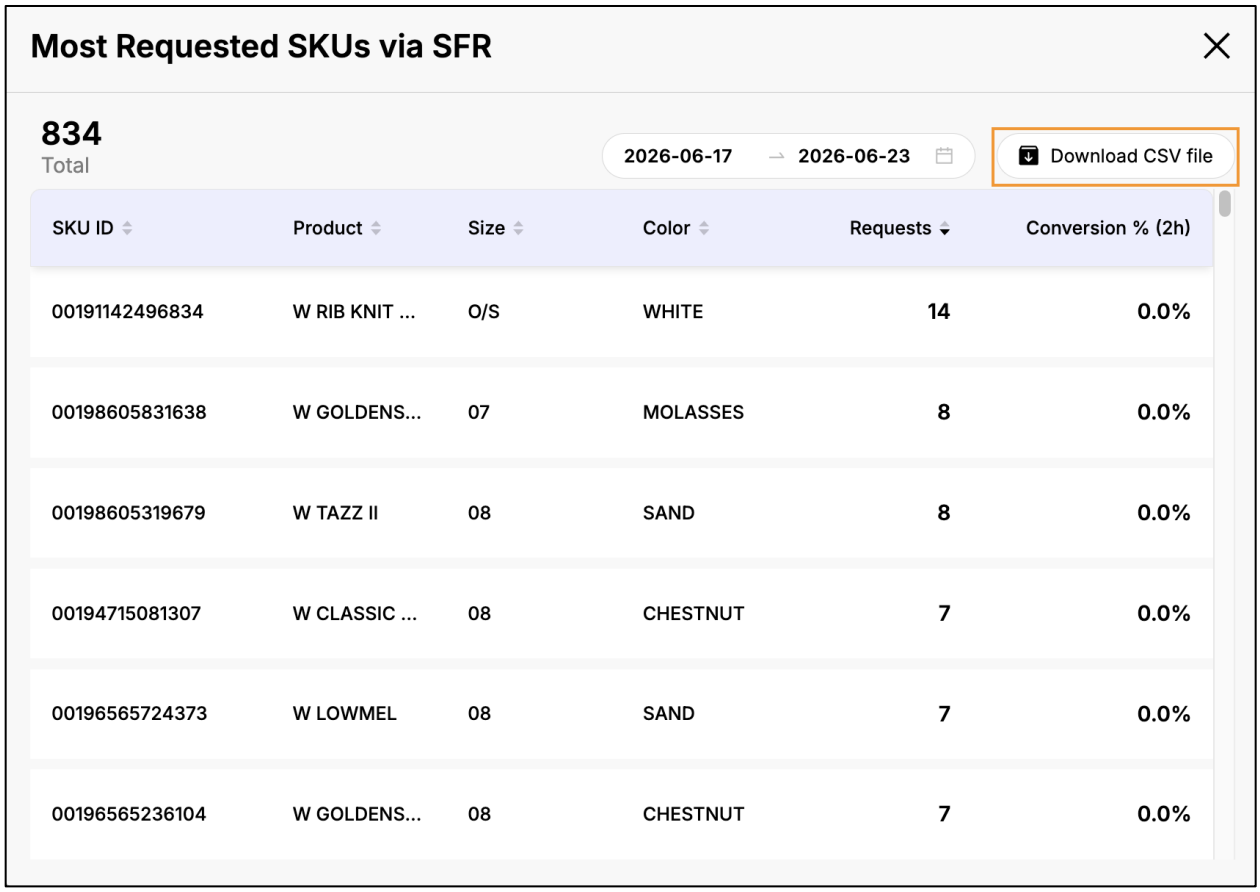

f. **Sales floor requests** – this displays items that have been requested to the floor in the Runner App.
    i. **Total Requests:** number of requests open, processed, completed and cancelled.
    ii. **Total items:** total number of products requested, skipped and picked.
    iii. **Item Request Conversion:** Items sold within 2 hours of try on **Note**: this metric will only be available once the POS integration is complete

g. HOKA Stores: You will see SafeSize data to review once this feature is live in your store.
h. Review **Most Requested SKUs** for a SKU level detailed request view on the sales floor and through Safe Size.

f. Click **View Trend** or **View** for details of each view.
    i. For View Trend, filter by **day or week**
g. **Export Data** as needed.

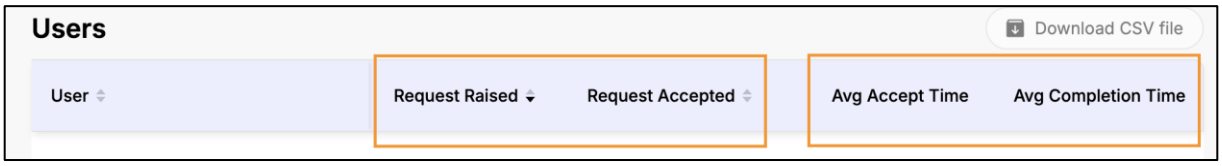

Usage Data (Store Usage Details)

The Usage Data section gives insight into who is creating product requests and who is fulfilling requests.

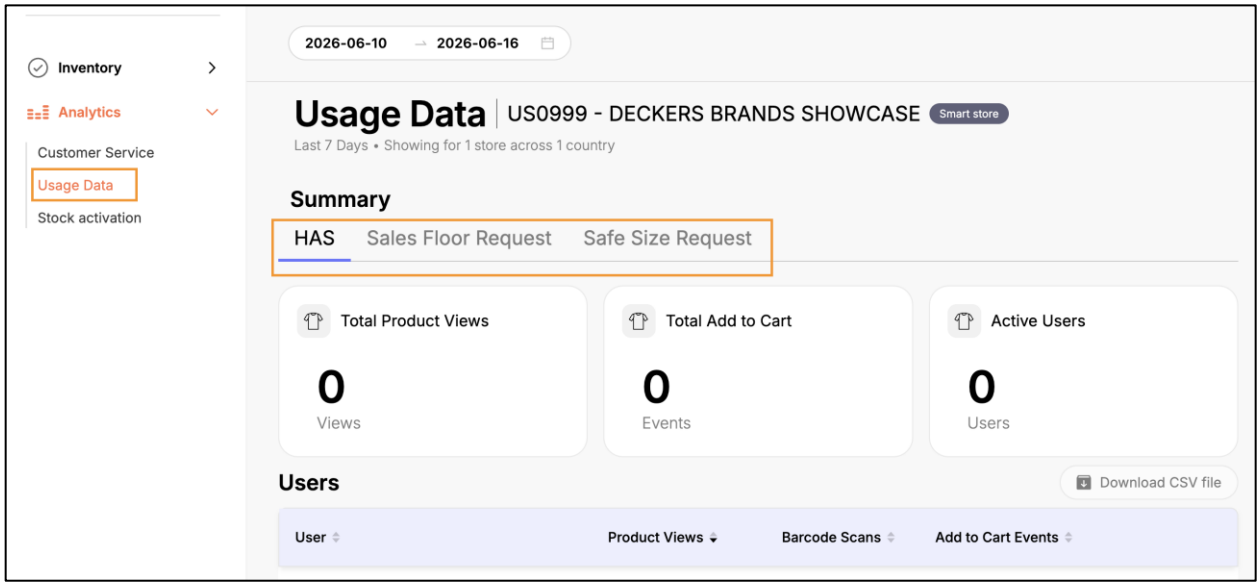

Summary View Details

- **HAS** (Help a Sale): Product searches.
- **Sales Floor Request:** The number of requests imputed.
    - **Users:** User Data in the same dashboard will give you request raised, accepted, average accept time and average completion time by user.
        - **Sales Floor Request:** Data will be shown for **Request Raised** and **Request Accepted.**

- **Accepted Request:** Data will be shown for **Avg Accept Time** and **Avg Completion Time.**

- **Safe Size Request** (HOKA)

Stock Activation (Overhead Reader Stores Only)

Shares EPC activation compliance within the sales floor and stockroom for stores with an overhead reader. *Not applicable for any other store*.

Shipping & Receiving Data Reporting

Shipping data provides insight into outbound/ inbound shipment activity.

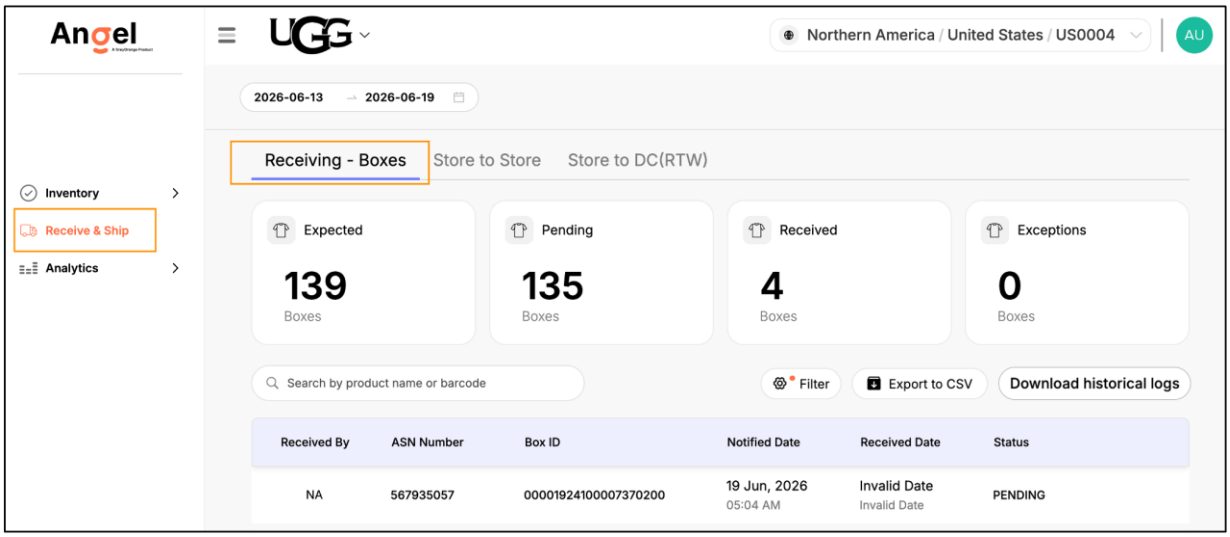

Reporting should update within 5 minutes of processes. If you are seeing delays beyond this timeframe, please open a helpdesk ticket.

1. Access the gStore reporting link.
2. Log in via **SSO** (if prompted)
3. Navigate to the **Receive & Ship** reporting feature on the left menu bar.

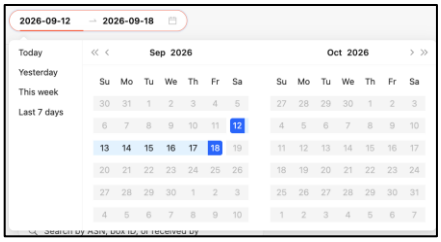

4. Select **Receiving-Boxes** to view incoming shipment details. This includes store to store transfer details, as well as warehouse deliveries.

   Note: Boxes will show as pending as soon as they have been dispatched in the system. Continue to validate delivery dates from your current Warehouse delivery notification process (e.g., ERP).

   TIP: ASN Numbers starting with 3 are store to store transfers created in gStore.

5. Update date range, as needed. Only 7 days of data is available to view and search within the dashboard screen. Select **Download Historical Logs**, to download up to 90 days of history.

6. Scroll to shipment list towards the bottom for a detailed review:
    1. Received by
    2. ASN Number
    3. Box ID / Carton Number
    4. Notified / Ship date
    5. Received Date (Invalid until received)
    6. Delivery status

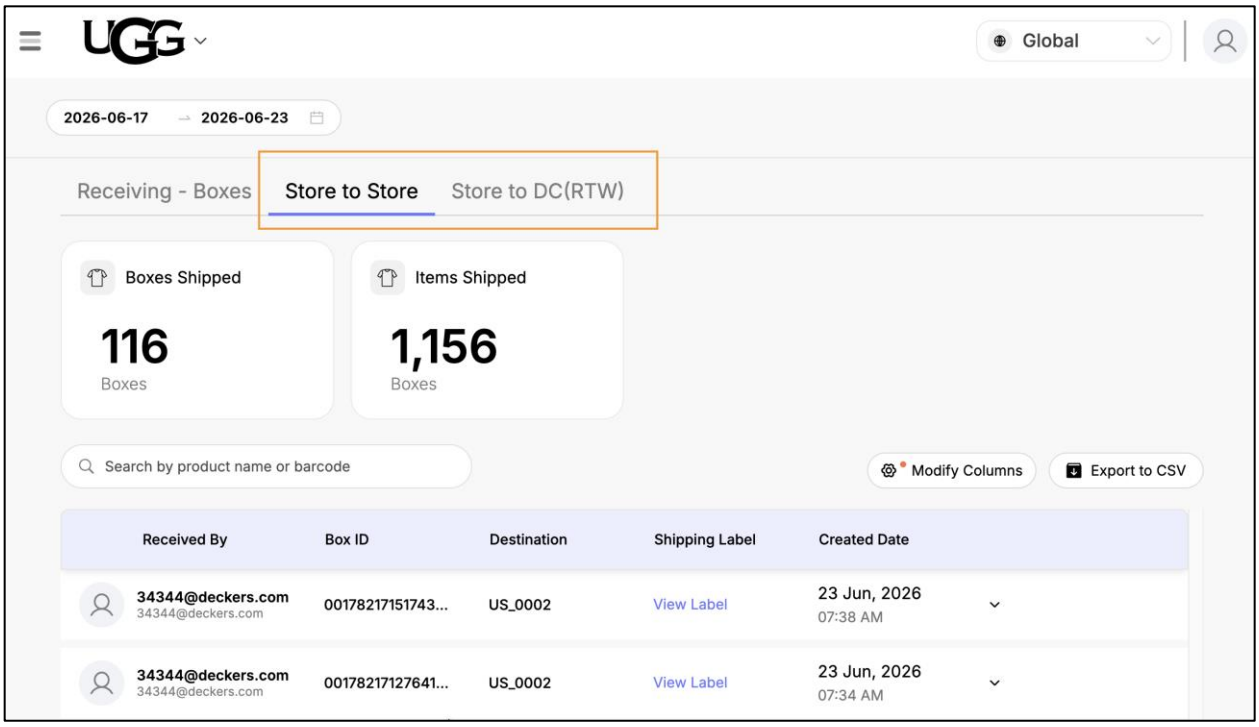

7. **Export Data** as needed.

Shipping Data Reporting

Shipping data tracks outbound inventory and delivery processing.

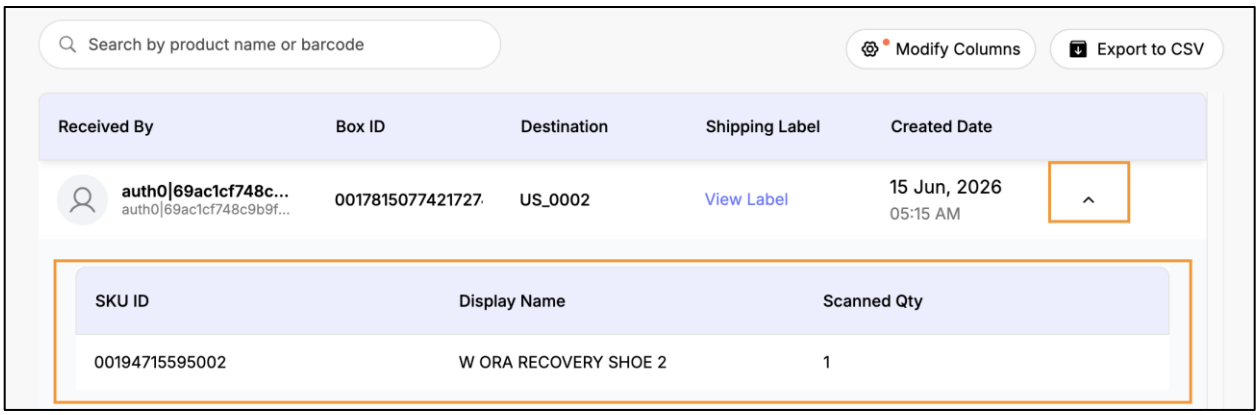

1. Log into the gStore reporting link
2. Select **Receiving & Ship**
3. Select **Store to Store** or **Store to DC** to review carton and item level details

   - Filter:
     1. **Store**
     2. **Shipping date(s)**
4. Review Shipping Metrics

- Total boxes shipped
- Total items shipped

5. Shipment Details
    - Click on a delivery record
    - Click **dropdown** to review the details of the carton including quantity of the items shipped.

6. Select **View Label** to review shipping label and print if needed.

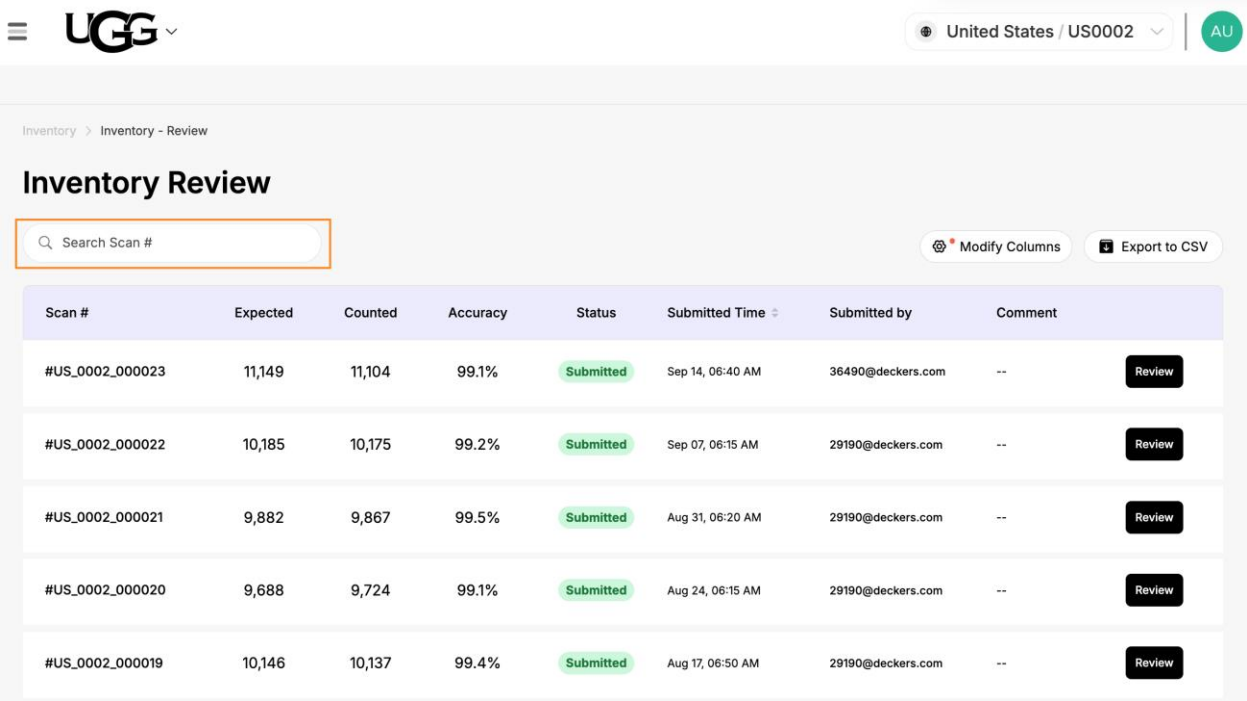

7. **Export Data** as needed.

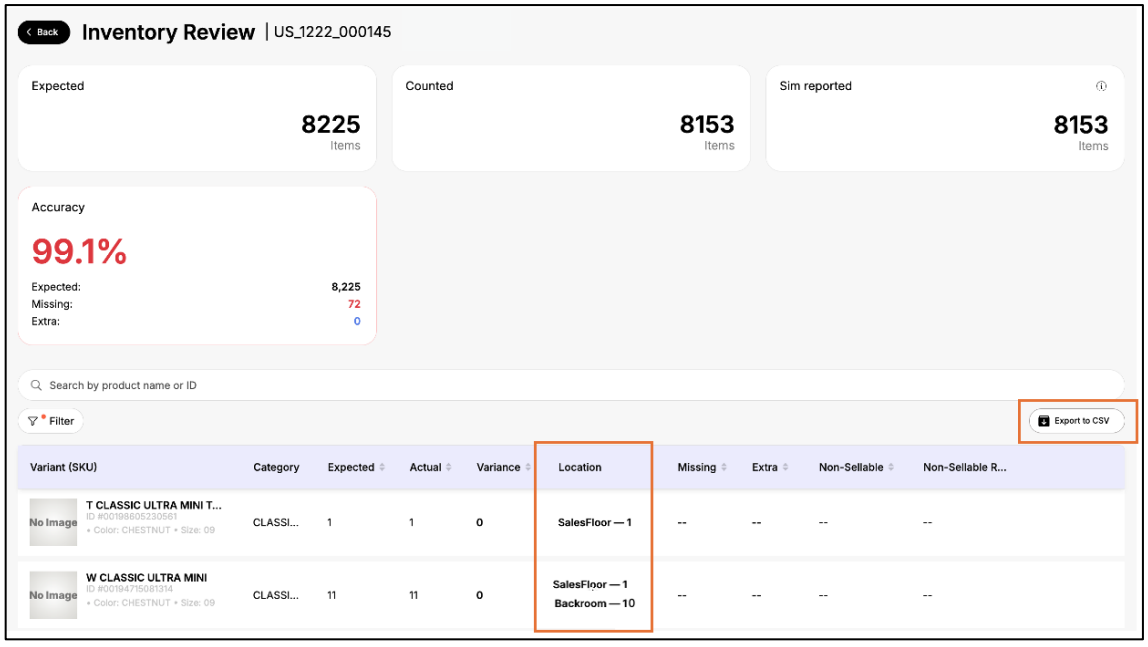

Cycle Count Data Reporting

Cycle count reporting tracks inventory accuracy and compliance.

1. Access the gStore reporting link.
2. Click the drop-down arrow by **Inventory**
3. Select **Inventory Review**
4. Search or locate the Cycle Count you want to review from the Inventory Review List
    a. Expected, Counted and Accuracy rate now visible

5. Click **Review**:
6. You will view:
    a. Expected Items
    b. Items Counted
    c. SIM Reported
    d. Variance totals, and accuracy rate
    e. Item-level detail, including the location the item was counted in.
7. **Export Data** as needed, utilizing the Export to CSV button.

Support & Questions

- For access or technical issues:
  - Submit a **Help Desk Ticket**
- For additional clarification:
  - Reach out to your **Regional Retail Operations contact.**

Quick Troubleshooting

- **App Version/Install:**
  1. Verify you have current version installed.
  2. If needed, open **Apps@Work**
  3. Tap **Update/Reinstall**.
- **Sled Won't Connect:**
  1. Ensure BT light is blinking.
  2. To pair OS **Bluetooth** in gStore, open the **sled icon.**
  3. Scan **sled serial.**
  4. Confirm by viewing **Device is Connected** message on device.
  5. For first time pairing, hold **trigger** to secure connection.
  6. Disconnect the battery and restart the device to start fresh.
  7. If your device is offline and the RFID sled becomes disconnected, reconnecting it may cause the app to crash. To avoid this, first reconnect to WiFi and submit the location, then reconnect the sled.

FAQ's

GStore Overview	
What is gStore and what is it used for?	gStore is the new platform for inventory management and the Runner app. It supports product requests, cycle counts, shipping, receiving, and a new try-on experience.
What inventory processes can be performed in gStore?	gStore supports receiving, shipments (store to store and Return to Warehouse), RFID tag encoding, RFID status updates, and full cycle counts across all store locations (salesfloor, backstock and offsite where applicable).
gStore App	

Does gStore require a manual app download or ticket?	The app will be pushed automatically to stores. Stores will be notified when available. Once notified, you can also download and install from the Ivanti Go App, as needed.
Access	
Do I need to open a Retail Help ticket for leads to get gStore Access?	Keyholders and above are automatically set up as Approvers through SSO login, based on Workday setup and does not require a ticket with Retail Help unless there are issues with logging in.
Login	
Do users need MFA to log into gStore?	No, MFA suppression is now working with App version 2.52.1 (7464). If any users are still encountering issues, open a helpdesk ticket with the user details.
RFID Encoding	
Can stores encode right away?	Yes. Items not in the Halo Master file, must be encoded in gStore, such as Duffield Throws. Encoding should begin after the gStore app is pushed to store devices.
Can I encode items for display only, to identify if I am missing any key styles?	Do not create new EPC tags. Instead, you can utilize the RFID status of Display or On Mannequin to identify these items, without affecting your Cycle Count accuracy. Visibility to items with this status will be found in Cycle Count reporting. An enhanced Display experience is planned for future enhancements.
Cycle Count	
Where does Location Accuracy come from when searching for products or fulfilling requests?	Recent **Cycle Count** as well as the item location selected during **Receiving**. The gStore App shares where an item should be located based on that Cycle Count and receiving activity. If an item is not showing in the correct location in gStore, you can update it by connecting to an RFID sled and selecting **My Work**> **Inventory Management>** and **Change Product Location**, then following the prompts.
During a cycle count, I am picking up items through walls or partitions from another area. Should I count everything together in one location?	This is normal in stores with partial walls or open spaces. RFID may pick up nearby items, but each item is only counted once. gStore assigns the final location based on where you were closest during submission (shown as the Overlapping number on the count summary). Keep counting items in their true location. Accuracy matters most and location will sort itself out. If you already combined areas, no need to recount. Just follow this approach on future counts.

How do Cycle Counts work in gStore?	Cycle Counts are completed by scanning RFID tags within each item's designated location. Be sure to scan in the correctly labeled location, as this is used for Runner App requests. The system uses sled-to-tag proximity to ensure each item is counted only once and assigned to the correct location.
What day will stores complete their first Cycle Count?	Stores will complete their first Cycle Count on the scheduled launch date, which may differ from your normal schedule. After launch week, stores should plan to resume the schedule shared by Regional Operations.
What happens if a Cycle Count does not meet accuracy thresholds?	Counts below the 98% threshold require review by Regional Operations and may need manual adjustment if accuracy does not improve over multiple counts.
How early can I start a cycle count?	Begin Cycle Counts at 5:00 AM local time or later to ensure accurate SIM stock on hand (updated overnight). Do not receive transfers the morning before your cycle count as they will not be included in the SIM Snapshot and will cause variances. Reschedule your cycle count, if possible. If you must proceed with a cycle count shield or remove items from the field of RFID capture during the count and only receive after a cycle count is approved to avoid variance and/or double counting.
Why does my count show an earlier start date?	When opening the Cycle Count function, if a count was started on a previous date, you will now see a system notification to delete the count and restart to match the new expected Stock on Hand.
What happens when I start my cycle count and the accuracy rate is showing negative?	The count may start at a negative accuracy rate if you have negative stock on hand in your inventory. There is nothing to worry about and you should continue your count as normal. Negative stock on hand will be adjusted in SIM once the 98%+ threshold is achieved on an approved count. If you are unable to achieve 98%+ within 4 counts, after all troubleshooting and due diligence is completed, partner with your Regional Operations Manager to manually approve SIM adjustments to get you back on track.
Can multiple people scan at the same time?	Yes, once a cycle count starts, you can add multiple users based on available hardware and devices. Results are combined into one total and are not shown by user. Each EPC is counted only once, even if scanned multiple times. Users can scan different locations at the same time. Please make sure you are selecting the physical location you are counting before you begin!

We finished our count, is there anything else we need to do?	After the count is submitted, leadership review is still required. The count must be approved through the Inventory Review process in the left menu for the cycle count to be considered completed.
I have a storage unit onsite but not considered a stockroom. What location should I count it in?	If you can quickly get to an onsite storage unit for customer try-on requests, include this location with your “Backroom" location. Future Enhancements have been requested to create store specific, instead of generic locations.
Will we continue to do the RFID Material Variance report on The Deck to also explain each variance?	There is no change to the RFID Material Variance report and will continue follow current processes.
Is there anything special I need to do when scanning in offline mode?	If your device is offline and the RFID sled becomes disconnected, reconnecting it may cause the app to crash. To avoid this, first reconnect to WiFi and submit the location, then reconnect the sled.
What do I do if I have a location that doesn't have product to count in my cycle count list (e.g. Offsite)?	Each location needs to be completed to submit your count. 1. Go to a spot in the store away from product, start and finish your count quickly with either zero items counted or only a few items counted. When all locations are complete submit and approve your count. EPC tags will only be counted in your total cycle count once. 2. Open a ticket with the helpdesk requesting the extra location is removed for your store. This should be completed by the time you complete your next cycle count.
How can I add an Offsite if I don’t have one?	A few days prior to your cycle count, submit a helpdesk ticket requesting and offsite location is added to your store for your next cycle count. Include the scheduled day so that the work on the backend can be completed prior to your count day.
My count was not approved on the same day as we counted. What should we do?	Cycle counts must be approved on the same day they are completed. You cannot approve a count on a later day. If the approval step is missed, the count is invalid and must be discarded and redone on a different day. To discard the count: Open the top left menu (four orange boxes) 1. Tap **Inventory Review** 2. Tap **Review** for the count 3. Tap **Reject** 4. Tap **Discard**

	After discarding the count, submit a Deck ticket to the Operations team to inform what happened and the date you plan to complete the replacement count.
Hardware	
What device can we access gStore from?	gStore is available on MPOS devices only and is not available on the iPads. iPhone: NA, EMEA & Japan. V2Pro/X5 Android MPOS: China
Are we getting new hardware?	No new hardware is needed; all current ZEBRA RFID Sleds are compatible with gStore.
Where can I locate the serial number to connect the RFD40 Sled (black)?	The serial number is on top after removing the cover. See photo example on tab RFD40 below. You can print and laminate a photo of the serial number barcode and attach it to the sled to prevent needing to remove the cover every time.
Offline Modes	
What functionality can we still do in offline mode?	Cycle count has some offline functionality, follow the instructions in the training guide for the best success. No other processes have offline availability currently.
Shipments/Transfers	
Will there be a way to print a pack slip for store transfers?	Yes, printed packing slips are not available from the app to your store printer.
How can I receive transfers that were created outside of gStore?	If you are receiving a transfer originally shipped in Halo → Receive it in Halo If you are receiving a transfer originally shipped in SIM → Receive it in SIM
How should I send transfers to stores not using gStore yet?	If you are sending a transfer to a store that is still using Halo → Send it from Halo (US & CHINA) If you are sending a transfer to a store that is still using SIM → Send it from SIM (JAPAN & EMEA)
Receiving	

When can stores begin using gStore for receiving?	Receiving will move to gStore after the first cycle count is completed. See details about Shipments/Transfers above to see when to utilize Halo.
How does receiving work in gStore?	Start by scanning the cartons. Then scan the items using RFID. As you scan, some items may appear in the Missing tab. This only means those items were not detected by RFID, not that they are truly missing. When you are finished scanning, select **Finish**. **Important**: Selecting Finish completes receiving for the **entire carton**. Items in the Missing tab: Do not prevent receiving, do not block the carton from being received, and do not create or trigger inventory adjustments. **All cartons are received in full once Finish is selected.**
Why does gStore show items as Missing after scanning EPC tags during the receiving process?	The Missing tab shows items not yet captured by RFID. Regardless of the RFID tags scanned, cartons are received in full once **Finish** is selected. If missing items are identified, please visually validate that all items have EPC tags when putting items away, and encode new tags as needed before your next cycle count.
Will a carton fail to receive if items are missing?	No. All cartons are fully received if **Finish** is selected. The RFID scan does not impact the items that are received.
The confirm box contexts screen is confusing!	Do not worry about the items showing on the Confirm Box Contents screen. To complete your receiving functions, select **Finish**. All cartons will be fully received regardless of what was RFID scanned during the Scan Box Contents process.
Can unrecognized cartons be received in gStore?	No. If a carton shows as unrecognized, delete it and scan it again. If it is still unrecognized but should be receivable, open a helpdesk ticket with the carton details and sending location, attaching photos if possible. Set the carton aside or remove the label until the issue is resolved. If it is not received before the next cycle count, the items will appear as extra on that count.
Can I complete any receiving functionality offline?	Receiving functionality currently requires a wi-fi or hotspot connection. An enhancement has been requested, but this requires development and will not be available right away.
How can I validate shipping and receiving	Utilize SIM to validate shipping and receiving as needed (there could be a 30-minute to 1 hour delay). If you do not see details after one hour, open a ticket with the helpdesk including as much detail as possible for the tech teams to check on the backend. Once items

functions were complete?	are shipped or received you can also validate changes in your stock on hand numbers for an easy validation. More visibility and reporting is coming soon!
What can I do to update items in New Status?	Items with New status have not been received in gStore. Check your In Transit reporting and complete the receiving process if needed. If no shipments remain In Transit.
How can I receive a box if the carton label is missing or damaged?	If the carton number is legible, hand key into gStore. For a DC shipment, you can also check the ERP for the carton number. If the Carton number is missing, open a ticket with the helpdesk including the sending location, and the Shipment Number (or External Number) from SIM. More visibility and reporting are coming soon!
Shipment	
Can I resume creating a transfer shipment if I did not finish it?	Yes. You will be prompted to scan the carton barcode to resume the correct shipment. At this time, you can only resume a transfer that you started.
Runner App / Try-on	
How does the Runner app support the try-on experience?	Use the Runner app to request products by size, color, and style while staying with the consumer. Requests are fulfilled by other team members and tracked in the app.
Is there a standard for how many items should be requested in the Runner app?	Yes. Training reinforces a global standard of requesting at least two additional style suggestions when supporting a try-on experience.
Is the try-on experience brand-specific?	The initial rollout is brand-agnostic to support both HOKA and UGG. Brand-specific experiences will be developed later as part of our service programs.
How fast are Runner App requests from pick to floor?	Requests are nearly instant. The system tracks accept and fulfill times for coaching and recognition.
What happens to Runner App requests if an item is damaged or offsite?	Items should be updated to the correct RFID status (damaged, offsite, etc.), which removes them from Runner App availability while maintaining inventory accuracy. Items at offsite are not available in the Runner App search, to exclude these from requests.
Can Runner App requests be	SafeSize and Runner App integration is being piloted in select stores, with improvements planned after broader rollout.

submitted from SafeSize devices?	
What Runner App analytics are available?	Reporting dashboards are currently in progress. gStore tracks request creation, fulfillment, timing, and associate participation to support coaching and performance insights. gStore also tracks the specific items being requested, and through POS integration can identify conversion rate of what was tried on and sold.
When can I start using Runner App?	As soon your cycle count is completed, regardless of automatic SIM adjustments or not.
Do I have to use the Runner App for every single try-on?	The Runner App is designed to help improve the try-on experience for both our teams and our consumers, but it is not required for every single try-on. We know that staffing models and store-specific constraints can vary, so each store should find what works best for their team and daily operations. That said, the more the Runner App is used, the more data we are able to capture to better understand our consumers at a deeper level and continue improving the experience over time. Many teams choose to use it during high-impact moments, such as when staffing is strongest, or integrate it into everyday processes where it adds the most value. Use it in ways that best support your store, your team, and the overall customer experience.
Can I log in to the Runner App we had on the iPad?	GStore is available on the iPhones only. The old Runner App link to DOMs has been decommissioned and is no longer usable as it is being replaced by gStore.
Display Labels	
Can I print new box labels with only regional sizes and UPC?	Yes, starting with version 2.59 international sizes are now printed on display labels.
Labels / Pricing	
What pricing label formats are supported in gStore today?	There is only one label option to select from gStore. This label now includes the current price. If that price is a markdown or clearance price, the original price will show with a slash thru to indicate is has been marked down. If the price is incorrect, utilize SIM to print the label as needed.
Do prices show up correctly in gStore?	Yes, pricing shown is correct. Note, China pricing is managed in Burgeon and will not be available in gStore.
Reporting / Analytics	
Will there be a gStore Portal or Reporting?	To access gStore reporting, go to https://us.gstore.cloud

Damages	
Do we still process Damages in SIM?	All Damages should have RFID tags updated to Damage status in gStore while physically in store to prevent them from being available for Runner App requests. Sending these items as an RTW - Damages will remove the status and create the transfer in the same step.
Ecom Returns	
How can I make sure Ecom returns are not included in my cycle count?	All items scanned during a cycle count will be included. As a best practice, remove, shield or ship out online returns before counting to ensure they remain excluded from your cycle count.
Replenishment Functionality	
After cycle counts, we utilize the Replenishment option from Halo to replenish the backroom. Is there a similar option in gStore?	Replenishment from Offsite to Onsite, or Onsite to Salesfloor is a future functionality of gStore. In the meantime, visibility to what was scanned at offsite is in your count file. Future reporting will also help tackle this request!
